THROUGH THE YEAR with The Book of Knowledge

This unique Calendar will enable you to use The Book of Knowledge in such a way as to relate appropriate items of information to a particular day—indeed, to every day in the year, if your fancy lies that way. It thus provides an opportunity for you to gain all kinds of useful general knowledge in an easy and entertaining way; and if you were to do it regularly, it would solve for a whole year the perpetual problem of "What shall I read?" Although such a method of using This Book of Knowledge has not the consistent purpose of that suggested for those who use the "Study Outlines" given in the next section of this volume, it is certainly far more rewarding than a desultory turning over of the pages day after day without any particular object in view. All the references in the Calendar give the number of the volume first in black-face type, and this is followed by the number of the page of that volume in which the appropriate information is to be found. Thus 7-243 means that you should take Volume 7 and turn to page 243. Nature Notes for each month are also given. Those for January will be found on the next page.

JANUARY

NEW YEAR'S DAY, 5-409. Bank Holiday in Scotland.

1308 William Tell's revolt began, 7-255; Switzerland, 7-213.

1916 Allies began evacuation of Gallipoli. Turkev, 7-334; World Wars, 7-480.

B 8

JANUARY

Nature Notes Snow or sun, or dull dank mist, or sullen rain, or earth-binding frost, may be predominant in the New Year. Whatever the circumstances, never does the great outdoors lack interest. A white earth-carpet is patterned with dainty footprints of food-seeking birds: but the early worm is beyond reach. For earthworms (3-153) burrow deeply to escape the cold. Bolder imprints are made by scurrying rabbits (6-328), and haves (4-132), and other non-hibernating mammals. Weighted down under the white burden, the branches of yew trees (7-513) and other evergreen conifers (2-183) have a fairyland effect, especially when viewed in the silent moonlight. If sunshine be but a fitful glean through leafless trees, it lights up the long reddish-brown male catkins of the alder (1-97) and of the birch (1-430). The swaying catkins might be passed unnoticed; not so the "real" flowers on a larger scale. Welcome indeed are the salawdrops (7-78) and the earliest crocuses (2-533), engendering as they do the deceptive belief that spring is close at hand! The thin but penetrating little song of the robin (6-415) offers fine encouragement, too, as does the wildly tuneful music of the missel-thrush (7-271) poured from a swaying tree-top in stormiest weather. Indoors, a warm fire wakens to too early activity a tortoise-shell butterfly (2-145) that had gone to sleep in a dark corner, bidding for safety in hibernation (4-173)

7 1450 University of Glasgow founded. Glasgow, 4-28; University, 7 368.

1610 Galdeo discovered the satellites of Jupiter, 3-498; Astronomy, 1 280; Jupiter, 4-386, 387; Planets, 6 212; Telescope, 7-248.

1785 English Channel first crossed by air (Blanchard and Jeffries). Balloon, 1-354.

1922 Anglo-Irish treaty ratified. Ireland, 4-281. United Kingdom, 7-352.

1337 Giotto, Italian painter, died, 4-21; Italy.
Art of, 4-317; Renaissance, 6 386.

1679 La Salle, French explorer, reached Niagara Falls. Great Lakes, 4-69; Niagara Falls, 4-69.

1775 John Baskerville, British printer, died. Birmingham, 1-474; Type and Typography, 7-341.

1886 Severn Tunnel opened. Railways, 6 357, Tunnels, 7-328.

1918 President Woodrow Wilson issued his Fourteen Points for world peace, 7 456; United States History, 7-362

Jan. 8, 1676. Niagara Falls in North America, first reached by Jean Baptiste de La Salle, celebrated French explorer.

9 1816 Davy's safety lamp first used in coal mine 3 54: Lamps, 4 442: Mines, 5 215.
1920 Last of Kolchak's White Russian troopsurrendered to Bolsheviks. Russia, 6 172.

1945 U.S. forces landed on Luzon. Philippines, 6 156

10 1645 Archbishop Laud beheaded, 4–453. Charles, British Kings, 2 306. 1838 Wren's Royal Exchange burnt down.

Lloyd's 4-532; London, 5-21.

1399, Delhi captured and plundered by Tamerlane, 3 66; India, 4 239; India; History, 4-254; Mongols, \$ 237.

1848 Hudson's Bay Company acquired Vancouver Island, British Columbia, 4 200; British Columbia, 2 82.

1935 Saar voted by plebiscite to return to Germany, Germany, 4-1.

14 1667 Pietro Francesco Cavalli, Italian pioneer in opera, died. Opera, 5-513.
1742 Edmund Halley, English astronomer and scudent of comets, died. Comets, 2-168; Gravitation, 4-65; Star. 7-147.

JANUARY

THE STARS IN JANUARY. Here we give the first of a series of charts showing how to read the stars month by month. They are shown as they appear at about 9 p.m. (Greenwich Time) in the middle of the month and about four minutes earlier each succeeding evening. With this map you can study the stars from the middle of January to the middle of February. You are looking southward in Oxford towards Hertford College and the Bodleian Library, but the stars are seen in virtually the same positions, looking south, from all parts of Britain.

1898 Charles Lutwidge Dodgson ("Lewis Carroll"), author of Alice in Wonderland, died. 2-251; Children's Books, 2-356.

1923 Speeches broadcast by radio in New York distinctly Reard in England. Radio, 6-340. .

Nature Notes Fallen kaves may rustle dry and cusply, for February fill dike ' does not always live up to its moist reputation. When they lie sodden and slippery underfoot and the ditches are indeed running with water, frogs (3-472) begin to show by earn croaking that they have had enough of sleep these past months and are almost ready to begin laving chains of jelly like eggs. Where ground is not waterlogged fresh mounds of soil indicate where moles (5-5) is etunn lling. Overhall in the branches squirrels (7-140) are out and about, theirs is only a partial libernation, and it really hard weather closes in again they will probably go back to skep. Deeper slumber his upon the hedgehog (4-153) and even violent disturbance will scarcely waken it before the month is out. The first brimstone butterfly (2-140) flickers like a scrap of windblown paper. The children (3-352) sings, robust and heartening and high in the blue a sky lark (4-147) trills. Near a to earth the hedge-sparrow (1-123), and the vellow buntu g or yellowhammer (2-124) match their songs against the melodious whistle of the blackbird (1 177). A rancous note is struck by the rocks (6 11) noisily building or is building nests in the swaving tree tops. Here and there among brenches while they clamber is a haze of subdued colour purple where the early clin (3-237) flowers show. Does a 3-27) specific the turf, they like shepherd's purse (7-20) are in flow r at nearly all times of the In hedgerow and thin woodland hazel (4-143) catkins held promise of next autumn's nuts

1708 Castaway Alexander Selkirk discovered on Juan Fernandez Island (rusoc, Robinson 3 2

Feb. 10, 1906. The name *Dreadnought* has been borne by first-class ships of the Royal Navy almost continuously since 1573. The ninth *Dreadnought* (above) was the forerunner of the modern battleship. Her normal displacement was 17,900 tons, her speed was 21 knots, and she was equipped to repel torpedo-craft. The cost of construction amounted to almost £2,000,000.

THE STARS IN FEBRUARY With the aid of this picture any boy or girl in Britain can study the stars between the middle of February and the middle of March You are supposed to be standing in Parliament Square, Westminster, facing south, with the Houses of Parliament and Westminster Abbey ahead. The thin lines join up the stars of each constellation. The objects underlined, such as the Great Nebula in Orion, should be looked at through a telescope or, if that is not available, through field- or opera-glasses steaded against a wall

Feb. 15, 1564. Galileo Galilei, Italian astronomer and physicist. His telescope created a revolution in astronomy.

1788 Trial of Warren Hastings began at Westminster Hall, 4 136; Calcutta, 2 172; India: History, 4 251.

Feb. 24, 1500. Charles V (above), Holy Roman Emperor and King of Germany and Spain, is here depicted by Titian.

MARCH

Nature Notes: Though winds of March are proverbially chill; and night sometimes sketches frost patterns (3, 477) on the window pane, increasing sunshine sets fields and woods iglow with the pulse and colour of new life. Gay nodding daffoldis (3, 25) golden dandelions (3, 40), the gold and the silver catkins of palm, willow (7, 151), young fronds of bracken form (2, 37) just beginning to uncurl and hawthom like flowers on leafless branches of the slow or blackth in (6, 228), and lovely evidence of spring on the way. The 1sh trees (1, 203) too are sporting small but profuse flowers. A very great accision (to match the coming of the daffeldis) is the arrival of the first swallows and martins and swifts (7-197). The greenfunch (3, 352) sing. The blackbir is (1, 477) are laying brown speckled bluish green eggs, and majestic rivens to 366) are already sitting A gor.

I mited peacock butterfly (2, 139) flits a trifle uncertainly through warming sun rives and a nestful of not so pleas intends (1, 160) sends out scouting parties to report on general conditions. The pet fortoise (7, 201) tempted out perhaps unsersonably crisis sle july from its winter quarters to search the guiden for juncy seedlings. Hamless grass snake, 4, 65) and venomous adder or viper (7, 402), charging from where they have slept for months begin their glifting search for food—especially slow moving slugs (7, 70), includious frogs, and similar fare

APRIL

Nature Notes Waves of blossom sweep the country-side refreshed by April showers. Most trees have clothed themselves with new leaves (4-469), refreshing greenery acting as foil for pinkish apple blossom (1-185), snowy white pear (6-100), plum (6-288), and cherry (2-327). The tremendous "candles" of horse-chestnut (4-197) are alight. Primioses (6-287) clothe the hedgehanks, bluebells (1-494) and wood anemones (1-150) the woodland open spaces. The returning cuckoo (3-7) is heard, and the nightingale (5-436) sings. Parent birds are busy finding food for fledgling-Evidence of foraging success is often shown in the thrush's "breakfast table" (1-153), a largestone on which the bird hammers to pieces the shell of a victim snail (7-73). White butterflies (2-139) are unwelcome in the vegetable garden, for there, on cabbage plants, they will soon be laying egg. The superb dragonfly (3-112), a veritable "flash of light," swoops at winged prey above the poind in which its larvae will presently be devouring most things encountered, including even tough waterbeetles (1-415), and newts (5-407) which are now making their way to the ponds to breed. And the fox's "earth" sees a great deal of coming and going, for now the cubs are born (3-126)

ALL FOOLS' DAY, 1-186.

1578 William Harvey, discoverer of the circulation of the blood, born, 4-135. Anatomy, 1-143; Blood, 1-492; Medicine, 5-162.

MAY

Nature Notes Fragrance of hawthorn (4-142), more often called "may," and of elder (3-207) and of lilac (4-506) in the garden, is associated with this month. Beech trees (1-407), and holly (4-187), and oak (5-489) produce their flowers—much less noticeable than will be the later beech nuts or 'mast," and red berries, and smooth, plump acorns. Fragile blossom of water-crowfoot (7-429) stands a little way above the surface of the pond. Eerie hoots and startling screams of owis (6-11) a-wing in late evening precede the night-long hunt for mice (5-288). Another strange call comes from that other bird of the dusk, the night-long hunt for mice (5-288). Another strange call comes are out. In sunshine, small blue butterflies (2-140), and the small copper butterfly (2-139), zigzag like scrape of coloured paper. Wasps (7-424), in intervals of pouncing upon and eating flies, are founding new colonies. That giant among insects, the stag-beetle (1-415), wears such a forbidding aspect that most other creatures leave it alone. Lizards (4-530) bask in the sun, or dart away, as numble and noiseless in movement as the aquatic water-rat or water-vole (6-365), and as the sleek sticklebacks (7-157) ready to defend their nests of waterwerd against all comers. Above the water, may flies (5-150) live out their few hours of winged flight. As day draws to its close, the badger (1-345) cautiously leaves its burrow to search out its supper of field mice or other small creatures.

MAY DAY; also kept as Labour Day. Month, 5-255; Odin, 5-500.

1707 Act of Union between England and Scotland. Anne, Queen, 1-159; English History, 3-281; Scotland, 6-513.

JUNE

Nature Notes Midsummer Day tails in this month of fixming June the month of wild dog roses and sweet briar and all the gard in roses (6.453). Sweet honeysuckle (4.190) is in flower, in I wild flig irises (4.284), water likes (7.428) in ponds and sluggish streams, watercress (7.127) in wayside ditches, and in waste places and odd corners the nettles (5-303). Those stringe flowerless plants the fungi are represented by white or grey pufficills (3 fixing p. 489), sometimes is large as a foot ball. The flycatcher (3.402) is living up to its name, and the wight (7.100) restlessly imming or walking keeps its tail dways wagging. Larly morning dew (3.82) sprukles on the spiders webs (7.152), and when the sun strike hot in the grass them is much brisk charpin, and leaping of grass hoppers (4.64). Skipper butteriles 2.139/140) and tertiflatics (2.138) are mong, lunes numerous lepidopters (4.269). Ladybirds 4.430 and their hungry large in busy among the uphi is (1.182) and there is much to won let it in the swi ming of those (1.105). A fitting glimpse is had of a dormouse (3-107) among the trees and bushes where it lives. Silently ribbit hunting in the immine or toat (3.215) and the slightly smaller but no less bloodthristy we is 1.7.150. The blooding of sapes and hoes and the teeming life affords plantial instances of prote two color doin (6.206).

JULY

Nature Notes: Purple heather (4-114) stretching to the horizon beneath a sweltering sun is a goodly aght, and to it bees flock in multitudes to collect from the flowers need a for their horizon making. Associated with heather is the harchell (1-194), the true blue bill of Scotland. Indired white flower heads, burney tell willowherb (7-155), a didy heinleck (4-161) with flat white flower heads, burney in a recommendation of a green carpet of dickweed (7-129) speckled with extremely small flowers. The stringe sundew (7-190) of moist places extends a slender flower stalk from its crimson tinted to sette of insect eathing leaves. The flish of a kinglisher (4-404) downstream continuts with the somewhat leasured flight from tree to tree of the black and white chattering magne (5-80). High or theird a kestrel (4-140) hovers almost motionless scinning the ground for food. A familiar call will be lacking for mother year, the enckoo (3-7) leaves this another next for South Africa. Big exterpillars 2-263) of hawk moths (2-114) are esting their fill be leave of lime tree (4-509) and popilar (6-259). A sudden cruption of flying ants (1-160) marks a rung in swarning from crowded in sts. A toad (7-208) disturbed from this abundant least makes as 20 at high ray to deput at crawls awkwardly away unlike the calle frog which hops and jumps

1908 Boy Scout movement instituted by Sir Robert Baden-Powell, 2-33; Baden-Powell, 1-345; Girl Guides, 4-22.

July 28, 1794. Robespierre, French revolutionary leader, met his death at the guillotine. On the previous day, in trying to evade his enemies, he had been wounded above picture.

Blackberries are ripening (1-477) in great abundance and bilberries (1-445). Very tempting, too, in appearance are the showy berries of bittersweet (1-177) and nightshade (5-439), but both are poisonous. The tall teasel (7-235) in flower never fulls to attract attention. Thistle down (7-270) is floating in the wind a notable mistine of seed distribution (6-528). Hops (4-192) are ripe and any day now will see great activity among the aromatic vines. Combieds are golden, and havesting (4-134) of the wheat begins. The diminutive harvest mouse (5-288) finds the occasion full of unwelcome excitement. The distinction of being a gaine bird falls be evily on the grouse (4-99); the shooting season opens on the 12th. For many kinds of bird, fallen shout now that family activities are over the initial autumn moult (1-169) commences. A holiday by the sea offers high hand acquaintance with the intriguing habits of a great diversity of er atures the commonest including startish and seasonement (7-150), cackles and mussels (2-137) july tish (4-360) and crabs (2-523) and in shallow rock pools, sea memones (6-524). There is much wonder in the forms and colours of shells (7-24) and of seaweed (6-526) tossed up on the beach. Lossils (3-124) in sometimes be found by searching among the debris of the chiffs and rocks (6-124).

1759 Battle of Minden, French defeated by British and Hanoverians Seven Years War, 7-2.

1798 Battle of the Nile, at which Nelson destroyed the French fleet. Nelson, Lord, 5, 363, Nile, 5, 440
1831 London Bridge opened. London, 5, 20, Thames, 7, 263.

Nature Notes A thinner, barer landscape is the impression now that he is es (4-472) are failing from the decidious trees (7-308). Its thick coils about a sturdy trunk, the evergreen is y (4-332) displays bunches of yellowish green flowers. Queer patches of variously coloured and squat plant life called lichens (4-490) repay close inspection. A fairy ring (3-339) shows up on an expanse of short turf as with terms (3-340), these tungs multiply by means of spores (8-530). Bud visitors arriving for the winter include the woodcock (7-467). Swins (7-108) with their young ones, called eygnets, swim plicidly about on still, quiet waters. The month bodes ill for the phe crint (6-153), the close season for which has ended. Standing motionless in a shallow stream is a beron (4-170), until suddenly it stabs with lightning motion at a fish, or frog. or water-vole, or cell. A wonderful story has behind the nugration of older cells (3-170) to the sea at breeding time, from pond, ditch, lake, or river they travel by night, overland if necessary. Supping daintily at the juice of a bruised apple or other spoiled fruit is a gorgeous red admiral butterfly (2-138). Attached to tree-trunk or palings, pupae or chrys dids (2-136) of various butterflies and moths can be found, other pupae he buried in the top soil at the foot of trees. A group of insects called winter moths (7-161) engage in egg-laving activities which cause fruit growers and others considerable trouble and expense.

Nov 30 1874 Sir Winston Churchill was born at Blenheim Palace, home of the Dukes of Marlborough The picture above was taken 79 years later

Plantations of young fir trees (3-356) and spruce (7-139), are drawn upon heavily to supply the traditional Christmas trees. Older plantations are frequented by the crossbill (3-352), a finch whose mandibles are crossed at the tip to enable it the more easily to extract seeds from the cones. That remarkable, white-berried plant the mistletoe (5-228) is much in evidence as seasonable decoration, as also is holly (4-187); it is worth noting that not all holly leaves have prickles. The tree that produces sweet or Spanish chestnuts (2-332) for roasting or boiling differs markedly from the horse chestnut (4-197) which produces "conkers." Turkey (7-332)-gobbler or bubbly-jock of the farmyard-and fat goose (4-46) are in demand. Flooded meadows are attracting migrant ducks (3-130). As an immigrant from northern Europe, the wood pigeon (6-197) or ring-dove joins the resident British birds.; Sleek and shiny and cheerfully noisy, starlings (7-151) roost together at night in enormous numbers. House crickets (2-531) chirp indoors in warm, dark places. Wood brought in for burning is often riddled with tunnels made by the larvae of beetles (1-415); and when loose bark drops away a woodlouse (7-467) may fall with it. Small water-creatures suitable for the aquarium (1-188) are still active, including the lively minnow (6-604), and pond snails, clinging to submerged water-weeds, though one may need to break the ice (4 228) to dip the net.

1640 Portugal became independent of Spain. 6-269.

1768 Royal Academy of Arts founded. Academy, 1-9; English Art. 3-258; Painting, 6-36 (picture).

1783 First ascent in a hydrogen-filled balloon, 1-353. 1844 Queen Alexandra, consort of Edward VII, born. 1-100. Edward, Kings of England, 3-169.

1941 British battleships Prince of Wales and Repulse sunk by Japanese aircraft. Navy. 5-343; World Wars, 7-491.

1843 Robert Koch, German bacteriologist, born, 1-343-44; Germs, 4-14; Medicine, 5-164 (picture).

1936 Abdication of Edward VIII, 3-169; George V. 3-522; George VI, 3-522; United Kingdom, 7-352. 1941 Germany and Italy declared war on the U.S.A. World Wars, 7-491.

1945 Formal opening of the new Waterloo Bridge. Bridge, 2-65 (picture), 66; London, 5-25 (picture).

Dec. 10, 1928. This circular arcade at Piccadilly Circus Underground station, London, is just below street level.

Dec 14, 1918. A mother with her family registers her vote for the first time at the British post-war election.

1821 Gustave Flaubert, French novelist, born. France: Literature, 3-456; Novel, 5-472.

1901 Marconi received his first transatlantic wireless message, 5-122; Radio, 6-340, 342, 343, 345.

1911 George V's great Coronation Durbar at Delhi. Delhi, 3-65; India: History, 4-253 (picture), 254. 1925 Riza Pahlevi became Shah of Persia, 6-132.

1545 First assembly of the Council of Trent. Reformation, 6 378; Roman Catholic Church, 6-426.

1553 Henry IV of France (Henry of Navarre), born, 4-164; France: History, 3-450; Huguenots, 4-202; Nantes, 5-316.

1816 Ernst Werner von Siemens, German engineer, born. Iron and Steel, 4-294.

1939 Battle of the River Plate. World Wars, 7-488.

1324 Pierre Puvis de Chavannes, French painter, born. France: Art, 3-440. 1895 George VI, King of England, born, 3-522: Elizabeth, the Queen Mother, 3-236; Elizabeth II, 3-233; Margaret, Princess, 5-124. 1918 First British general election in which women voted (supported a coalition government). Lloyd-George, 4-531; United Kingdom, 7-352; Vote, 7-407.

37 Nero, Roman emperor, born, 5-367. Christiavity, 2 379; Rome: History, 6-437.

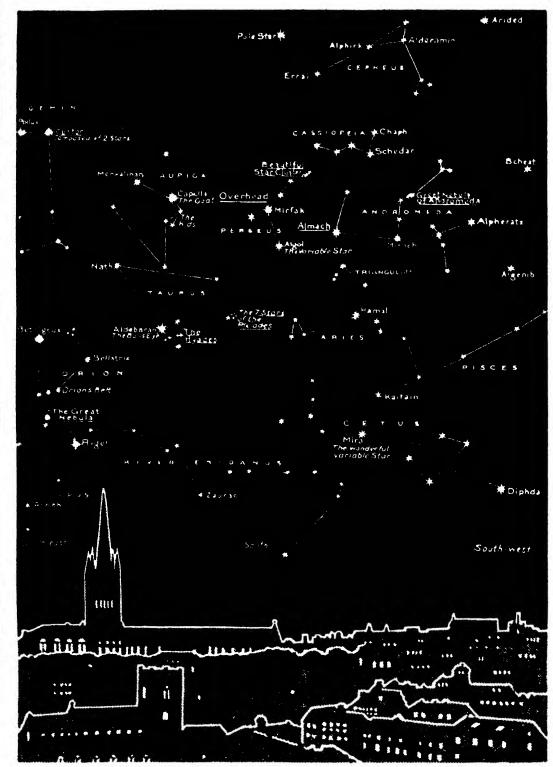

1610 David Teniers (younger), Flemish painter, baptised. Netherlands: Art, 5–382, 390 (picture).

1734 George Romney, English painter, born. English Art, 3-259 (picture), 260.

1832 Alexandre Eiffel, French engineer, born. Paris, 6-79 (picture), 84.

1927 Prayer Book revision measure defeated in House of Commons, 6-280.

1714 George Whitefield, English preacher, born. Wesley, John, 7-440. 1773 " Boston Tea Party," opening the War of American Independence, 1-137; Boston, 2-22.

THE STARS IN DECEMBER. With this map you can study the stars from the middle of December to the middle of January. You are looking southward in Norwich and can see the cathedral on the left of the picture. The stars, clusters, and nebulae that are underlined in the map should be viewed with a telescope or with field- or opera-glasses

Dec. 16, 1775. Jane Austen's house at Chawton, Hants where the famous novelist lived during the years 1809-17

1775 Jane Austen, English novelist, born, 1 311. English Literature, 3-290; Novel, 5 472.

1838 Defeat of Dingaan, Zulu chief, by the Boers: anniversary kept in South Africa as The Day of the Vow. Natal, 5-325.

1911 Amundsen reached the South Pole. Polar Exploration, 6–244.

17 1807 John Greenleaf Whittier, American poet, born. United States: Literature, 7-364.

1903 Orville Wright made the first flight in a heavierthan-air machine. Aeroplane, 1-26, 38.

1907 Lord Kelvin died, 4-395. Cable, 2-153; Joule, 4-385; Radio, 6-341.

1939 German battleship Admiral Graf Spec scuttled. World Wars, 7-488.

1944 Rundstedt's final counter-offensive in the Ardennes began. Ardennes, 1-222: World Wars, 7-495.

18 1707 Charles Wesley, English divine and hymn-writer, born, 7-439. Free Churches, 3-464; Hymns, 4-226.

1786 Carl Maria von Weber, German composer, born. Opera, 5-514.

1829 Lamarck, French zoologist, died. Evolution. 3-321; Zoology, 7-526.

1856 Sir J. J. Thomson, British physicist, born. Atom, 1-297; Electron, 3-221.

1865 Slavery abolished in U.S.A., 7-66. United States: History, 7-362.

1914 British protectorate over Egypt proclaimed. 3-178.

19 1790 Sir William Parry, British Arctic explorer, born. Canning, 2-212.
1851 J. M. W. Turner, British painter, died.
7-337. English Art. 3-261, 269 (picture): Painting.
6-34.

20 1192 Richard Coeur de Lion captured by Leopold of Austria, 6-399; Crusades, 8-2. 1845 State of Texas incorporated in the States, 7-260; United States: History, 7-362.

21 **1118 Thomas Becket, English prelate, born, 1 402; Canterbury, 2-213; Henry, Kings of England, 4-162.

1846 First major surgical operation in Europe under a general anaesthetic carried out by Robert Liston. Anaesthesia, 1-142.

1879 Josef Vissarionovich Stalin, Russian dictator,
born, 7-141. Georgia, 3-524; Russia: History,
6-476; Trotsky, 7-318.

1920 World's first regular broadcasting station opened in the United States. Radio, 6-346.

22 1716 First pantomime in England played at Lincoln's Inn theatre, 6, 60: Harlequinade, 4-133.

1768 John Crome ("Old Crome"), British painter, born. English Art, 3-260, 269 (picture): Norwich, 5-467

1808 Beethoven's 5th and 6th ("Pastoral") Symphonics first played, at Vienna, 1-411; Music, 5-305; Orchestra, 5-527.

1916 Ministry of Pensions set up. Pensions, 6-120.

23 1732 Sir Richard Arkwright, English in Exentor, born, 1 239. Spinning, 7 136; Weaving, 7-434.

1777 Alexander I, Emperor of Russia, born Napoleon I, 5-320, 322; Russia, 6-474.

1827 "Lord" George Sanger, circus proprietor, born. Circus, 2-404.

1834 Hansom cabs patented. Road Transport, 6-412 (colour plate, facing p. 412).

1920 Government of Ireland Act passed, 4 283.

24 1167 John. King of England, born. 4-378: English History. 3-277 (colour plate, facing p. 277): Government, 4-58: Magna Carta,

1491 Ignatius de Loyola, founder of the Jesuits, born,5-46. Reformation, 6-377.

1924 Ahmed Ben Zogu (later King Zog) led insurrection, overthrowing Albanian government. Albania, 1-92.

Dec. 23, 1834. The popularity of the hansom cab (above) declined with the swift increase in motor traffic

Dec. 27, 1673. St. Helena (above), home of the exiled Napoleon, where he died, has an area of 47 square miles

25 Christmas Day, 2-381-82; Holly, 4-187; Jesus Christ, 4-363; Mistletoe, 5-228, Pig, 6-197.

1497 Vasco da Gama touched Natal coast, 7 382.
Africa, 1-53; Natal, 5-325; South Africa, 7 89.
1941 Hong Kong surrendered to the Japanese, 4 191 (picture).

26 BOXING DAY. Christmas, 2-382.
1716 Thomas Gray, English poet, born,
4-67 (picture), 68; English Laterature.
3-288; Walpole, H., 7-416.

1776 British defeated by American revolutionary forces at Trenton, New Jersey. New Jersey, 5-398, 1944 Russians closed in on Budapest, 2-105, 106 (pictures); Danube, 3-48; Hungary, 4-205, 207 (picture).

27 Sr. John the Evangelist's Day.
1571 Johann Kepler, German astronomer.
born, 4 401.

1673 Island of St. Helena chartered to East India Company. Napoleon I, 5-323.

1822 Louis Pasteur, Freuch chemist, born. 6 94, 95 (picture); Canning, 2-212; Milk, 5-207; Surgery, 7-194; Tartaric Acid, 7-288.

1904 Barrie's Peter Pan first played on London stage,
1-372, 373-76 (picture story); Children's Books,
2-354, 355 (picture); English Literature, 3 291.

28 1065 Westminster Abbey consecrated, 7 442-44 (pictures): Britain, Battle of, 2-79: London, 5-19, 24; Edward, Kings of England, 3-166.

1846 Bloemfontein, Orange Free State, founded,
1 488; Orange River and Free State, 5 524 (picture).
1908 Messina, Sicily, virtually destroyed by an earthquake. Earthquakes, 3-153; Sicily, 7 49.

1929 Chinese Nanking government abolished foreign territorial rights. China, 2 373, 375.

29 1809 William Ewart Gladstone, British statesman, born, 4-26 (picture); Huxley, 4-212; Liberal Party, 4-485; Oxford and Asquith, 6-21; Umted Kingdom, 7-350, 351; Victoria, Queen, 7-396.

1895 The Jameson Raid penetrated into the Transvaal. Rhodes, 6 393; South Africa, 7 92.

1940 Great fire-bomb air raid on the City of London,
 5 20, 28; Britain, Battle of, 2 78 79; World Wars,
 7 -488 89.

30 1460 Richard, Duke of York, killed at battle of Wakefield Roses, Wars of the, 6-454,

1865 Rudyard Kipling, British poet and short story writer, born, 4 412-13 (picture); Children's Books, 2 354, 355 (picture); English Literature, 3 291.

1869 Stephen Leacock, Canadian humorist and educationist, born. Canada, 2 203.

1922 Union of Soviet Socialist Republies constituted by treaty. Russia, 6 472, 476, 477.

1947 King Michael of Rumania abdicated. Rumania, 6, 470–71.

NEW YEAR'S EVE. Scots Hogmanay celebrations. New Year's Day, 5, 410-11.
1384 John Wychffe, English reformer and translator of the Bible, died, 7, 505; Bible, 1, 442; English Literature, 3, 284; Huss, 4, 211.

1600 Honourable East India Company chartered by Queen Elizabeth I. India: History, 4 252-53; America, Discovery, 1 134; American Independence
1 137; Bengal, 1 428; British Commonwealth,
2 83; Clive, 2 411; Elizabeth I, 3 232; Hastings,
W., 4 136; United Kingdom, 7 350.

1763 Villeneuve, French admiral, born. Trafalgar. Battle of, 7-304.

1935 Great earthquake at Quetta, India. Earth-quakes, 3-153.

Dec. 29, 1809. Hawarden Castle, Flintshire, North Wales (above), for many years the residence of W. E. Gladstone, four times prime minister of Great Britain, was erected in 1752 by an ancestor of Mrs. Gladstone, to whom it passed in 1874.

STUDY OUTLINES

References to information scattered through volumes 1—7 are here assembled subject by subject for the Use of Students, Teachers, and Others in search of Knowledge

A Note about

The Book of Knowledge Study Outlines

WHILE the Fact-Index, which begins in page 205, brings out details of subjects and tells exactly where to find them, the following Study Outlines gather up the information in The Book of Knowledge into the groups that form the main divisions of human knowledge, and present it arranged for systematic study. The Geography Outline, for instance, brings together into a single consecutive chain all the material on Geography contained in Volumes 1 to 7, fitting each part into the other, link by link, until the whole of Geography has been surveyed.

These Study Outlines, however, are much more than mere "guides to reading," much more than mere titles of articles or of portions of articles arranged in tabular form. A glance through them will show that their subdivisions consist for the most part of brief notes and explanations which serve to bring out the significance of each step and its relation to what precedes and what follows. In other words, they are skilled teachers in print. It would be profitable, indeed, simply to read through many of these Outlines without looking up a single page reference, for each of them gives a rapid survey of the subject with which it deals. On the other hand, they are so arranged that those interested in only a single section of a wide field of study can use that section independently.

At the end of the Outlines is a list of books for supplementary reading. Many are not expensive to buy, and all will almost certainly be found in a good public library.

As in the other sections of this volume, in indicating to you where to find information clsewhere in The Book of Knowledge, the number of the volume is given first, followed by the page number in that particular volume. Thus the reference 7-245 would mean that you should consult Volume 7 at page 245. number of the volume is always in black-face type, the number of the page is also in black face when the reference is to the main article on a given subject, in light face when the matter is mentioned in some other main article. Thus 7 245 means that in page 245 of Volume 7 you will find the main article on the subject, 5-320 means that in page 320 of Volume 5 von will find a passing reference to it.

The Outlines follow in alphabetical order

AGRICULTURE

IT was a great day in the history of the human race when some ancient nomad for decided to settle down and begin scratching the soil with a sharp stick so that it would grow crops for him. Gradually men added one food plant after mother to their stock, they learned to domesticate animals, they grow flax and chipped the vool of their sheep that wives and daughters might spin and weave clothes for the household Meanwhile, the sharpened stick had given way to the ploughshare, and the forward march of human culture was measured by the improvements in agriculture. To this day Agriculture (1.70), remains the foundation of civilization

SOIL AND ITS COMPOSITION (7 83)

- A Water essential to fertility (6 360)
- B Artificial treatment of the soil .
 - a Mosture is supplied by arrigation and dramage
 - b (herical elements are supplied by animal manure), fortilisers (1.78), guano (f(i)), introgen and soil enriching crops (6.99), 6.217, 218, 5.444), lucerne (5.48), clover (2.423), mustard (5.312), soya bean (7.103).

Note For soil formation and kinds of soil, see Physiography (6 186)

II. POMESTIC PLANTS.

- A Propagation (3-504) Seeds and seed selection (6-216), 6-528), bulbs tubers, root stocks (2-118), grafting (3-478), harvesting (4-134-7-447)
- B Cereals. Wheat (7 447), oats (5 490) tye (6 482), barley (1 368) tice (6 396) millet (f \(\text{\ell}\)), maize (5 90)
- C. Pasture and Hay Crops: Grasses (4-63), clover (2-423), lucerne (5-48), legumes (see Legume nosae, f-1) soya bean (7-103)

D Vegetables.

- a Legumes Beans (1 390) peas (6 99), lentils (4 482)
- b. Bulbs, Tubers, Roots, etc. (2 118) Beet
 (1 410), parsmps (6 93), onions (5 511), potatoes (6 273), radishes (2-151), turmps
 (2 151), artichokes (1 257), tapioca (7 226)
- c Other Vegetables. Asparagus (1 274), cabbage, brussels sprouts, kale, cauditower (2 151), watercress (7 428), celery (2 286); cucumber (3 9), lettuce (f z) rhubarb (6 396), tomato (5 131)
- E. Spices and Condiments (7–131) Cloves (2–423), Ginger (4–21), mint (5–222), mustard (5–312), nutning and mace (5–486) pepper (6–121), vanilla (7–381)
- F. Sugar (7-183), cacao (2 438), coffee (2 444), tea (7 282), tobacco (7 286), hops (4 192)
- G. Fibre Crops: (otton (2.516), flax (3.387), hemp (4.161); jute (4.389); sisal (7.58)

H Fruits and Fruit-Growing (3 478)

a. Orchard Fruits Apple (1 185) apricot (1 186), cherry (2 327), mulberry (5 289) peach (6 99), pear (6 100), plum (6 228) prunss (6 298); quince and media (6 324)

- b Soft Fruits Currents 3 12, 483 illus roose berry (4 47), grape (4 61), loganberry (3 399), raspberry (6 364) strawberry (7 173)
- c Tropical and Semi-Tropical Fruits (1 359) breadfillet (2 52) date (3 52) fig (3 350), grapefrint (4 61) lemon 4 477) hmc (4 509), mango (5 113) melon (5 167, olive (5 507), orange (5 524), pincapple (6 204), ponegranate (6 256)

I Nuts. (5 486)

- a Temperate Zone Nuts (hestnuts (2 332), pistachio (5 487), hizel, cobnut, etc. (4 143), walnut (7 416)
- b. Sub-Tropical and Tropical Nuts Almond (1 117), brazil nut (5 487), coconut (2 441)

J. Vegetable Oil Crops

Oils and fats (5 506) ground nuts (4 98), coconut palm (copra) (2 441), cotton (2 516), olive 5 507) sunflower (7 190), soya bean (7 103)

K Medicinal and Miscellaneous Crops Opium (5 521), quimne (6 325), camphor (2-192), rubber (6 464), maple sugar (5 117) conk (2 505)

III LIVESTOCK AND LIVESTOCK PRODUCTS

- A Stock Raising and the Effects of Careful Breeding (2 273)
- B Common Domestic Animals and their Products
 - a Draught Animals Horse (4 196) mule (5 292), ass (1 275)
 - b. Cattle(2 273) and Pigs(6 196), meat (5-153
 - c Sheep (7 20) and Wool (7 473)
 - d. Goats (4 37)
 - e Poultry (6 277) Turkey (7 332) duci (3 130), goose (4 46), gumen fowl (4 104) pigeons and doves (6 197)
 - f. Insect Products Bees and honey (1/405) silkworms (7/53), sheliae (4/434), cochineal (2/436)
 - g. Dairy Farming (3 25) Milk (5 205 butter (2 134), cheese (2 313), crossin (2 293)
 - h. Other animal products Leather (4 466) feathers (3 344) turs (3 496)
- C Domestic Animals peculiar to certain regions Alpaca (1 119), butfalo (2 109), caincl (2 183) llama (4 530), reindect 6 379) vik (7 511) ostrich (6 8)

AGRICULTURE -- ARCHITECTURE

IV. ENEMIES AND FRIENDS OF THE FARMER.

- A. Animal Pests: Mice (5 288); rats (6 865); insects (4-264); aphids (1 182); beetles (1 412); caterpillars (2 263; 2 136; 4 448); grasshoppers and locusts (4 64); weevils (7 435).
- B. Harmful Plants: Poisonous plants (6 235); thistles (7 270); charlock (5 312), and other weeds; rusts and smuts (6 481).
- C. Farmers' Helpers: Buts (1 380). burds

(1-453); dogs (3 100); frogs (3-472); toads (7-286); ferrets (8 348); badgers (1-345); lady birds (4 436); hover-flies (4-267); bacteria (1-343, 5-443); centipodes (2 291).

V. FARMING MACHINERY, ETC.

Windmill (7 459); ploughs (6 223) and sowing machines; binders, reapers, threshing machines, etc.; milking and milk cooling machinery (3 27)

ARCHITECTURE

MEN began to build primitive buts and encampments long before they possessed the materials or thought out the principles upon which they have based the air and science of Architecture (1 209)—the name for the ordered, comely, sometimes magnificent building carried on through the centuries

I. EGYPTIAN ARCHITECTURE (3 155)

- A. Characteristics: Vast tombs of kings and solemn temples of the gods built by an enslaved population, massive stone buildings of the "column and lintel" type, with walls often sloping instead of perpendicular on the outside, use of column foreshadowing Greek architecture; profuse ornamentation, both carved and painted
- R. Notable Examples : Pyramids (6–312) . Temples (3–185–189) . Sphinges (7–130)

II. BABYLONIAN AND ASSYRIAN ARCHITECTURE.

- A. Characteristics: Gorgeous temples and palaces set on broad terraces, approached by imposing stairways and built of baked or sun-dried brick and enamelled tile, stone used in later period arch and turret forms common.
- B. Typical Examples: Hanging Guidens of Babylon (1 336 illus, f.; 1 377 illus f). Ishtar Gate (1 337), shime at Ur (7 360)

III. GREEK ARCHITECTURE (5 531, 532)

- A. Characteristics: The Aegean civilizations of Crete (1-23) and Mycenae (1-24) laid the foundations of Western Architecture from which the Greeks evolved their own. Characteristics of Greek architecture are anoble temples, theaties, gymnasia, etc., column and lintel type of structure, built of marble or of coarser stone covered with stucco, sometimes without roof, sometimes roofed with tiles or slabs supported on wooden beams, three styles or orders. Doric, Ionic, Cornthian (5-532, 521 illus.)
- B. The Three Great Styles:
 - a. Doric. Parthenon (1 210); temple at Bassae (4 82); of Zeus, Olympia (4 72 illus, f)
 b. Ionic. Temple of the Wingless Victory (4 82); Mausoleum at Halicarnassus, and Temple of Diana (7 1); Erechtheum (4 75 illus, f.).
 - c. Corinthian. Monument of Lysicrates (4-81)

IV. ROMAN ARCHITECTURE (5 532)

A. Characteristics: Stately, showy temples, monuments, basilicas, forums, amphitheatres, and circuses, and highly practical aqueducts and baths; richly ornamented structures built

- of brick, stone, and cement and concrete, and faced with brick, marble, or mosaic, structural forms included the arch, the vault, the dome, and columns of the three Greek orders were used frequently.
- B. Notable Examples: Pantheon (1 211), Colosseum (2 461), Forum (6 435 dlus f.), Baths of Caracalla (6 429 dlus f.); Arch of Severus (6 427), of Constantine (6 447), Hadrian's Wall (2 75, 3 275), aquediacts (1 188, 6 466), residences at Pemper (6 448).

V. BYZANTINE ARCHITECTURE (1 210)

- A. Characteristics: Huge squar churches, with magnificent interiors; domes placed over rectangular compartments by fleans of pendentives: buildings constructed of brick and stone faced with precious marbles and gorgeous mosaics. Much of this style is seen in Russian and Mahomedan architecture.
- B. Notable Examples: St Sophia at Constantinople (4-304)—St Mark's Cathedral at Venice (7-387)

VI. MAHOMEDAN ARCHITECTURE

- A. Characteristics: The architecture of the Mahomedans called also Moorish, Sameenic, and Arab architecture has many common features throughout the range of their religion. These include graceful gay based mosques with bulbous doines, round, lancet, and horseshowarches, slender minarcts, and fretted sere as in geometric patterns or arabisques, built of all structural materials, including marble, and decorated with exquisite mosaics and inlay of silver, gold, enaired, and semi-precious stones.
- B. Typical Examples:
 - a. India: Taj Mahal (7 219).
 - b. Persia: Grand Mosque, Isfahan (6 133)
 - c. North Africa and Spain: Morocean gute way (5 265): Alhambra (1 111); Cordoba (7 175); Seville (7 5).

VII. ROMANESQUE ARCHITECTURE.

Called 'Lembard' and "Tuscan" in Italy, Romano" in France, "Rhomish" in Germany, and including the "Saxon" and "Norman" of Britain. Probably originated about A.D. 600 in Lombardy and thence spread about AD 1000 westward and northward as well as south (to Sicily). Fo this period belong the great castles of Britain (2 256).

A Characteristics Diginfied churches and palaces and massive castles—round arches framing doors and windows and springing from round columns or piers, thick stone walls pierced with small windows, roofs at first flat and timbered, later varieted in stone by means of the plain barrel or grouned vault, decoration varies locally from crude and spare to rich and exuberant

B Notable Examples

a Southern Romanesque Pisa (6, 207) b Northern Romanesque Dinham (2, 271) Tower of London (7, 302) Chernalyon

Cistle (2 260)

VIII GOTHIC ARCHITECTURE

Divided into periods in different countries. Lancet, Bayonnant and Hamboyant's in France. I alv Lughish. Decorated and Perpendicular in England. This is the great period of cathedral building (2-264).

A Characteristics Wonderfully varied forms emphasising the vertical line and reaching to new heights with great lofty window spaces filled with stuned glass, pointed inch completely super er unded types and ogival vaulting with flying buttiesses permits, tone wills to be fur thinner than in Komanesque buildings and to consist chiefly of windows, deceration yincle often consisting in cecle ristical buildings of finely subture language.

B Notable Examples

a Continental Northern Gothic Notic Dame Pairs (6-81) Amiens (1-139) Rouen (5-449) Bruges (2-98), Antwerp (1-179) Southern Gothic Florence (3-302) Milan (5-204)

b English Gothic (i) Luly Linglish from sitional from Norman Y 1k (2, 269) Lincoli (2, 266) Salisbury (2, 265) Wells (2, 272) (ii) Decerated typified by fleri Linguight rose windows Glaszow (4, 29)

(m) Perpendicular tall marrow rectangular windows fan vaulting nave it Canterbury (2 268) – Magdalen Tower Oxford (6 19) Henry VII chapel Westminster (7 444)

IX RENAISSANCE ARCHITECTURE

A Characteristics Sumptions palaces charanx and chinches expressing not the spirit of whole peoples but the whims and moods of luxinious intellectual aristociacies, formal and classical by intention, most of the detail borrowed from Romen antiquity—ended in the over ornal mentation of Baroque and Rococo, no new structural features.

B. Notable Examples .

a. Continental St. Peters. Rome (6.428)
7.382). Palazzo Vecchio, Florence (4.318)
Louvre (5.46) and Opera House (6.83). Paris
b. In England. This was the great period of Paighsh architecture with which are associated

the names of Wich (7 500) Inigo Jones (4 381) Vanbrigh, Nash and the brothers Adam (1 14) St. Paul's Cathedral (6 487). St. Bride's typical Wich church (5 21) The later architects working at first in the classical Palladian style evolved gradually the fine English. Georgian houses from which present day English demestic architecture is descended.

X MODERN ARCHITECTURE

Characteristics After the Renussance the broad national movements in Architecture virtually ceased and new designs were the products of individual architects (see above), who originated a wide variety of schools more a less independent of one another. It was only with the advent of steel and concrete (see Building Construction, 2 111) that giest new structural principles were evolved, but even so in many ways old traditions lingered and as noted the traditional big Luglish house is due thy descended from Georgian structures Lion C. R. Mackintosh through Le Corbusier and Mallet Stevens functionalism spread everywhere in this style materials and build mgs were primarily suited to their express purposes and in effect was made for example to provide ideal constrons for the use of a building. Thus a factory where varkers work better with plenty of bent is nourly all windows. s is a school (1 213) Athentre is built to selve the problem - Litheatte 7 171 i one rt hall to selve the self musical production.

B Further Examples

a America In America steel independent bred the skys riper first constructed in Chica, (2) 334) adopted and made its win by New York (1) 216 (5) 416

b Continental and elsewhere - 1 mland (1-215), Retterdum (6-45b) - Russin (6-475) - Lel Aviv Falfa (1-271)

c English

1 Berdes such examples as these referred to above functional samplicity extends to public wirks, as in (2 478). Battersea Pewer Station (4 150).

2 Where necessary old a traducial styles are followed Bank f Fugland (1/362) County Hall 1 and at (5/24)

3 Much revived. Gothic was built in But a in the 19th century. Houses of Parliament (5/24)

XI OTHER ANCIENT ARCHITECTURE

This includes is plated types of architecture that have placed no part in the great chain of development dealt with above

A Chinese and Japanese Architecture

a Characteristics (c.y., bright computatively fright pagodas and memorial gateways built of wood brick, glized tile, and less often of stone feature is the tent like curved roof b Examples The Great Wall (2, 362), Japan (4, 344, 345)

B Hindu and Buddhist Architecture

a Characteristics Strange tombs shaines and temples, often scooped from the hying rock of caves and hills, or built of stone with high

ARCHITECTURE - ASTRONOMY

pyramidal towers, fantastically ornamented.
b. Examples: Buddhist temples (2-180; 4-356); Karli (4-246); Jaipur (4-247); Siam (7-45).

C. American Indian Architecture.

a. Inca Architecture: Structures composed of stones, often huge boulders, without mortar, but cut and fitted with extreme accuracy (6-140).

b. Maya Architecture. Earliest great period in Central America and Mexico. Stone faced with stucco. Narrow rooms, wide roofs necessitated by the false arch.

c. Toltec and Aztec Architecture. Houses of sun-dried brick and great pueblos, usually of stone; pyramid-temples and palaces of brick or stone elaborately decorated with carvings and gilding (1-881).

d. North American Indian Architecture: Log dwellings of most advanced hunting tribes; stone dwellings of the Cliff Dwellers; sundried brick dwellings of the Pueblo Indians.

ASTRONOMY

LONG before any of the other great sciences had been organized, men were busy investigating the mysteries of the heavens, and out of the speculations and observations of these early "star-gazers" came some of the most profound scientific truths which are described under the heading Astronomy (1 278).

I. HISTORY.

A. Ancient. The carliest astronomical observations were made on the banks of the Nile and the Euphrates, in desert climates where the stars shone clearly every night. The first grouping of stars into constellations (2-489) dates from this early period. By the time the Greek philosophers addressed themselves to the subject, records going back for many centuries were already available.

Ptolemaic System. Ptolemy (6-301) set forth in the 2nd contury A.D. the views which Hipparchus (190-120 B.C.) had elaborated from a suggestion of Eudoxus (4th cent. B.c.). These pictured a spherical earth in the centre of the universe, surrounded by nine transparent crystal spheres. To the first seven were attached (in order) the Moon, Mercury, Venus, the Sun, Mars, Jupiter, and Saturn. Over the whole surface of the eighth were scattered the fixed stars. The ninth was the "prime mover" whose rotation accounted for the daily motion of all the heavenly bodies. This basic pattern was elaborated by locating the centres of the spheres at a distance (called the eccentric) from the centre of the Earth, and by setting the Sun, Moon, and planets on smaller spheres (called epicycles) attached to the main spheres.

B. Modern.

- a. Copernican System. The theory that the Sun, not the Earth was the centre of the universe was held by Aristarchus in the fourth and Seleucus in the second century B.C., but was not generally accepted until revived by Copernicus (2-501) in the early 16th century A.D.
- b. Tycho Brahe (1546-1601) put forward a theory that the Moon and Sun revolved round the Earth while the other planets revolved round the Sun (2-38).
- c. Johann Kepler returned to the Copernican system and worked out the three laws of

planetary motion that still go by his name (4-401).

- d. Galileo turned the newly-invented telescope on to the heavens. His discovery of four satellites revolving round Jupiter, and of spots which revealed the rotation of the Sun, offered visual confirmation of the Copernican theory (3-498).
- e. Newton (5-408) brought all the known facts under a single mathematical theory embodied in his three laws of motion (5-159) and the law of universal gravitation (4-65).
- f. Laplace, in the Mecanique Celeste (1799-1825), completed the application of Newtonian theory to all the more important movements of bodies in the solar system.
- g. Einstein, in his General Theory of Relativity (6 380), substituted a geometrical for a mechanical picture of the operation of gravity, and was able to explain certain anomalies (e.g. in the motion of Mercury) which did not exactly accord with Newtonian theory.

II. THE UNIVERSE.

A. The Solar System.

- a. The Sun (7 188) is a star of rather less than average mass and brightness. Its diameter is about 864,000 miles, its mean distance from the earth about 93,005,000 miles. The temperature of its surface is between 5,000° and 6,000°C, and its colour is yellow. Markings called sunspets are visible on its surface; cruptions of luminous gas can be seen at celipses (3 156); electrons and other particles are emitted, which disturb radio communications and give rise to the appearance called the aurora (1-310).
- b. Planets (6 212). There are nine known planets revolving round the Sun in elliptical orbits. They are (in order from the Sun outwards): Mercury, Venus (7-388), Earth (8-149), Mars, Jupiter, Saturn, Uranus (7-370), Neptune (5-367), Pluto (6-228).

- c. Asteroids. Instead of one planet in the gap between Mars and Jupiter there are a large number of small bodies called asteroids, each revolving round the Sun in its own elliptical orbit (6-212).
- d. Satellites. At least six of the nine planets have one or more smaller bodies revolving round them (6-213). The Earth's satellite, the Moon, is 2,160 miles in diameter. Its mean distance from the earth is 238,900 miles, and its mass 0.01227 of the mass of the Earth (5-256).
- e. Comets. These are believed to be loose collections of stones, dust, and gas which travel on highly eccentric orbits round the Sun. Their origin is obscure, and their sporadic disintegration unexplained (2 468).
- f. Meteors. Small pieces of débris from the size of a grain of sand upwards constantly enter the Earth's atmosphere and become incandescent with friction. The occasional one which lands on the Earth's surface is called a meteorite (5-181).
- g. The Earth's Movements. The daily rotation of the Earth gives rise to night and day, and to the diurnal passage of the stars (7-146). The annual revolution round the Sun, combined with the inclination of the Earth's axis to the plane of its orbit, produces the seasons (8-526), the equinoxes and the solstices (3-294).
- h. Eclipses. An eclipse of the Moon occurs when the Moon enters the Earth's shadow; of the Sun when the Moon comes between the Earth and the Sun (3-156).
- 1. Origin of the Solar System. A number of theories have been put forward to account for this, but none is universally accepted. Best known are the nebular hypothesis (6-213), the planetesimal theory (6 214), the tidal theory (6-214), Aliven's magnetic theory, Weizsäcker's theory of roller-bearing eddies, and Hoyle's theory that it resulted from a supernova explosion of the sun.

B. The Galactic System.

- a. The Milky Way. The trail of more or less diffused light that circles the heavens (1-278) is really made up of vast numbers of separate stars, seen close together on account of the shape of the galaxy, or collection of stars, in which the solar system is located.
- b. Shape and Size. The galaxy is disc- or wheel-shaped, and probably spiral in structure, with the Sun some two-thirds out on one arm or spoke. It is about 120,000 light-years in diameter, and 20,000 light-years thick at the hub.
- c. Revolution. Different parts of the galaxy are revolving at different rates. The Sun is carried round about once every 225 million years at a speed of some 170 miles per second. At the same time the Sun and a cluster of the nearer stars seem to be moving at a speed of about 12½ miles a second relative to the rest of the galaxy.

- d. Stars. These are concentrated balls of gas which give off light because of their high temperature. This is maintained over many millions of years by processes of nuclear fusion. Stars are classified according to their magnitude or apparent brightness, and according to size, temperature, and the quality of the light which they emit. Many (called binaries) are in the form of two bodies revolving round each other (7-145)
- e. Cosmic Dust. Besides stars, the galaxy contains clouds of dust (1-283) and luminous gas.

C. Outer Space.

- a. Spiral Nebulae. Scattered through outer space are large numbers of spiral nebulae (5-360) which appear to be separate island universes in all respects similar to our own galaxy (1-284).
- b. Expanding Universe. The light from all of them shows a shift of spectroscopic lines towards the red. If this is interpreted as a Doppler effect, all must be moving away from us at a speed proportional to their distance. This has been taken to imply an expanding universe, and different formulae have been put forward by Einstein, de Sitter, and others to define the expansion
- D. Radio Astronomy. It has been discovered that high frequency radio waves reach the earth not only from the sun, but from many other directions in space. Very few of these other sources, however, seem to coincide with known objects in the galaxy, and no satisfactory theory has yet been put forward to account for the production of radio waves by ordinary stars, invisible stars, gas clouds, or any other agency (7-250).

III. PRACTICAL APPLICATIONS.

- A. Observatories. Most of the larger countries maintain one or more observatories (5 493) to promote both theoretical and practical astronomy. The chief instruments used are reflecting and refracting telescopes (7 248), spectroscopes (7-127), spectroheliographs (5 493), coelostats (7-189), transit instruments (7 149). Radar equipment is used for tracking meteors (5-182), and highly directional short-wave radio receiving instruments (radio telescopes) for other branches of radio astronomy (7 250)
- B. The Calendar. The problem of the calendar (2-174) is chiefly the problem of reconciling the incommensurable lengths of the day (3-55), the month (5 255), and the year (2-174). There are also complicated rules for determining the date of Easter 43 154) and other movable feasts in any given year.
- C. Measurement of Time. The final criterion for the measurement of time (7-277) was formerly the rotation of the earth. This gives the adereal day, or the time that elapses between two successive transits of a fixed star across a given

meridian (3-55). But it was discovered that the rotation of the earth is slightly irregular, and gradually slowing down; so that tune can be more accurately measured by magnetostriction in quartz clocks, or by the vibration of ammonia molecules in so-called atomic clocks.

D. Navigation. 'Tables (called ephemerides) giving the exact positions of the Sun, Moon, and planets at any given time are compiled at observatories.

On the basis of these tables, sailors and aircraft pilots are able to calculate their position on the Earth's surface by observation of the heavenly bodies (5 338). The only instruments necessary are a sextant (5 338) and a chronometer (2 383).

BIOLOGY

THE most wonderful thing in the world is Life. Since the earliest days of civilized thought philosophers have wondered at its manifold problems and have sought in vain to penetrate its mysteries. What is life? What is that magic thing, possessed alike by the tiniest plant and the great genius among men, which serves to set them apart from the "dead" rock of the hillside? The scientist of to-day is perhaps very little nearer to a final definition of life than were the old Greek sages. Yet of the facts about life he knows vastly more. It is with these facts that Biology (1 447) deals. It was not until the beginning of the 19th century that Biology was organized definitely as a separate science. About that time the knowledge of botany and zoology, anatomy and physiology, had developed far enough to suggest to scientists that certain great principles must run through all forms of Life, a study which came to be called biology. In the Nature Study Outline (in this volume) some of the most interesting and significant facts about plants and animals are examined—without, however, emphasising any general biological laws. Here the scope of biology as a science, and some of the more important characteristics common to all forms of life, are surveyed.

I. THE SCOPE OF BIOLOGICAL SCIENCE.

A. Biology is the Science of All Life.

- a. Botany (2 24)—Biology applied to Plant Line (6 214); Zoology (7 526)—Biology applied to the Animal Kingdom (1 154).
- b. Relations of Biology to Other Sciences.
 - 1. Chemistry (2-316) supplies data and methods for studying substances involved in life (food, tissues, fluids, such as blood and the sap of plants). An example is the chemistry of digestion (3-89). This aspect of chemistry is the chemistry of carbon compounds. Biochemistry (1-446, is the term used to describe the specific chemistry of life's processes.
 - 2. Physics (6-185) supplies data and methods for studying the effects upon life of physical states and forces, such as light, heat, electricity, etc. For instance, physics helps to tell why sup rises.
 - 3. Geology (3 515) assembles data concerning how the life environment" that is, the earth's crust, the air, the waters of the earth-came to have its present form. It helps to trace the history of life Ly studying the age of fossils, and this study is often given a separate name Palaeontology.

B. Chief Subdivisions of Biology.

- a. Cytology deals with the composition and structure of cells (2-286), the basic units from which all living things are built; Histology deals with the manner in which these cells are organized into living tissues; Anatomy (1-143) investigates the arrangement of tissues into organs, and the arrangement of organs in the living organism.
- b. Embryology (3-239) studies the development of individual organisms from the first

- single cell; Morphology applies the principles of the foregoing branches to a study of the causes governing the structure and torms of all living organisms; Physiology (6 189) investigates and describes the functions of the parts of the organisms.
- c. Ecology (3 158) deals with the relations of plants and animals to one another, to environment, effects of chimate, etc.
- d. Genetics (8-511) includes the study of the laws governing heredity in plants and animals, including Man. Plant breeding is an important development.
- e. Taxonomy (1 151; 2 21) is the classification and naming of living things, closely linked with, and almost the same as, Systematy.

II. BIOLOGY'S TEACHINGS THE LIFE PROCESS.

A. Things Necessary to Life.

- a. Chemical Elements. Of all those of which the earth is composed, 10 elements only, besides a number of so-called "trace-elements," are required by vegetable organisms. These are carbon, oxygen, hydrogen, nitrogen, iron, sulphur, phosphorus, potassium, magnesium, calcium; trace-elements include cobalt. copper, iodine, etc. (Sec articles on these elements.)
- b. Water.
- c. Heat and Light.

B. Combination of Matter into Life Forms.

a. The Cell (2 286) is the Combining Unit. The cell is the unit of all tissue, Many primitive plants and animals consist of single cells—Amoeba (1-140), Yeast (7-512). Higher

forms start as single cells in the reproductive process and grow by cell division

- b Chemical Nature of Cells—Plant structures are stiffened primarily with cellulose (2.287) animal structures usually with compounds of calcium and silicon
- c Basic Chemical and Physical Processes

 1 Late materials are obtained from air earth, and water by the process of 'Photo synthesis' (6 182). This is the secretar name of the process by which plants with the aid of sunlight use their green colouring matter (chlorophyll) to extract carbon from the cirbon dioxide of the air, and then combine that carbon with the minerals and water from the eight to mainifacture the materials from which plant cells are built.

 2 Plants alone possess the chief phyll necessary for photosynthesis. Animals live directly or inducetly on the food manufactured by plants.
 - 3 Many life processes are carried out through the actions of 1 maynes (3 293, 2 323)

d Food Absorption and Conversion

- 1 Single celled animals and plants obtain their fool by absorbing it through the cell walls. Many celled types usually have some k 1 continues into which 15 t is drawn and held while being absorbed.
- 2 Chemical nature of food conversion partly by chlorophyll in plants by digestive ferments in animals

e Distribution of Food

- 1 Circulation of sup in higher plants
- 2 (neulati n of blood in animals (1 489, 4 143 144)
- f Respiration necessary to all Forms of Life (5.51, 4.469, 470, 6.215)

g Indirect Ways of obtaining Life Substances

- 1 Parasitism (6 77), living upon bod material of mother living of mism. Typical parasites among plants rusts and smuts (6 481). Usually accompanied by degeneration of the parasite.
- 2 Saprophytism, living upon material of dead organisms (5 284 3 489). Mush rooms (5 301) are typical plant sape ophytics. 3 Symbiosis strictly a combination of two forms of life into a partnership each carrying on a separate share of the lift process, is in Lachons (4 490). In many instances, only one organism may secure apparent benefit.

h Disposal of used and waste Materials

- 1 By excretion
- 2 By respiration
- 3. By bacterial action

Organization of Life Processes

a Life Processes are carried out only through Individual Organisms. It is characteristic of all the phenomena of life that they are myanably found associated with individuals functioning as units. The parts of each unit are so co-ordinated that they are together toward a common end.

- b Co-ordinating Mechanism of Plants | Little is known of the force which control this feature of plant life. The manner in which the various parts of a given tree Li instance communicate with on moth Liso that each performs its proper part in relation to the whole tree is still a investery. Evidence of delicate co-ordination in Plants is well shown in the mechanism for fertilisation by misects (3,400), also in the Sensitive Plant (4,470).
- c Co-ordinating Mechanism in Animals The very primitive types of animals, such as spenges, present the same inviters in this respect as doplants. But, beginning with the Ielly fish, there appears a distinct equipment lefinitely suited for the coordinating process that is, a nervous system.
 - 1 Nerves and then work (5 368)
 - 2 Nervous systems of higher annuals culminate in Man's brain (1 150), the highest development of the coordinating mechanism $5 e \ a \ s$ Animal Behaviour (1 151) Migration (5 202)

Note Both Ann ils in l'Plants react to light heat chemicals, et by a sines to tree sons, which some numerates think control all his See I avec (4 469). Migration (5 202) Plant Life 6 214)

D Reproduction of Life

- a Asexual Reproduction. This consists of the production of one or in a case worz unisms from a single organism. It may take place in one of the following ways.
 - 1 By Fission, or division into two approximately equal parts as in Amarba (1 140) and Bacteria (1 343)
 - 2 By Budding, or the outgrowth of one or more now organisms which, soon i or later may be separated from the parent againsm Hy his (4 213) Sponges (7 137) Yeast (7-512) and some plants such as fright
 - 3 By Spore Formation (6 2)9)—that is by the production of a mute bodies usually consisting of a single cell which is liberated and can grow into a new organism. Ferns (3 346) and I ung (3 488) produce spores
- b Sexual Reproduction (2 257). This consists of the union of two cells or Gametes (4 166). Often the two types of cells are found upon the same individual, as in most flowers.
 - 1 The male cell is called a sperm
 - 2 The female cell is called an ovum or e_ng cell. In one instances, Parthenogenesis, takes place, an untertilised female being capable of producing young usually them selves intertile females, as in certain aphides (1 182) and in some sawilies.
 - Note Many organisms reproduce by a process which combines the associal and the sexual method; and this is termed alternation of generations. The process in plantconsists of (1) the ascend production of a spore. (2) the growth of the spore into a "gametophyte" or sexual plant, (3) the sexual production by the gametophyte

of a "sporophyte" or non-sexual plant, which in turn produces spores again by the asexual process. Examples of this process are seen in Moss and Ferns (3-346). In some insects, such as Aphides (1-182), there is a different alternation of generations. This occurs also in many parasites.

- E. Development of Life.
 - a. Embryology (3-239).
 - b. Egg (3-172; 1-460).
 - c. Seeds and Spores (6-528).

III. HISTORY OF LIFE.

- A. Evolution (8-321).
 - a. Various Theories: Buffon (2-110); Darwin (3-51; 3-323); Later Theories (8-324). b. What Geology Tells of Evolution (5-104); the story of Fossils (8-425).
 - c. Some Examples of Evolution: Horse (3-322; 4-196; 1-156); Elephant (3-227); Flatfish (3-377). Survival of primitive types Marsupials (5-137); Opossum (5-521).
- B. Heredity and What It Means (4-166).

BOTANY

Classification of Plants

COUNTLESS difficulties confront botanists in the classification of plants and various writers differ widely in their arrangements. But such differences are not important to the general student. The classification below does not pretend to be complete, but includes only those groups which are either of scientific importance or can be readily studied. Students should begin by reading the general articles on Botany (2-24), Flowers (3-395), Leaves (4-469), Roots (6-451), Plant Life (6 214), Seeds and Spores (6-528), Trees (7-308). The main divisions in this classification of plants (4-515) are Phylum, Sub-phylum, Class, Order, Family, Genus. The phylum is indicated by a Roman numeral (I, II, III, etc.), the sub-phylum by "sub-ph.," and the others by the following abbreviations: Cl., Ord., Fam., Gen.

I. THALLOPHYTA.

Simplest plants, usually distinguished by having a "thallus," that is, a body which has no differentiated organs such as flowers, wood fibres, leaves, roots, etc. Forms range in size from the microscopic to the enormous, for example, the giant kelp (a seaweed). Most types reproduce by simple division or by spore formation, but higher types have primitive sexual characteristics. The simpler Thallophytes are frequently grouped together as Protophyta, equivalent to the Protozoa (6-298) of the Animal Kingdom. Among the classes of the Protophyta are many of those included among the Algae and placed there in the table below. Others, however, show features more akin to those of animals than plants, being for example motile; these are sometimes called Flagellata. Among these simplest forms were the ancestors of all the higher plants.

Sub-ph. ALGAE (1-104). Includes those Thallophyta which contain chlorophyll.

Cl. Chlorophyceae: "Green Algae," simple one-celled forms and multicellular forms, with no colouring matter other than chlorophyll. Reproduction either sexual or asexual.

Ord. Volvocales: Single-celled plants capable of moving about with the aid of "cilia" or vibrating hair-like organs; often classed as animals in the group Flagellata. Typical genera, Volvox (common species, globator), Chlamydomonas.

Ord. Protococcales: One- or many-celled motile or non-motile forms. Typical genera, *Pleurococcus*, Green Slime, often found in colonies on damp stones, tree trunks;

Hydrodictyon, Water Net, forming net like colonies sometimes a foot long.

Ord. Ulotrichales: Simple unbranched filaments of many cells. Ulothrix is a common fresh-water genus.

Ord. Oedogoniales: Freth-water filamentous forms. Typical genus, Oedogonium. Ord. Ulvales: Thallus flat or tubular. Bestknown genus, Ulva, Sea Lettuce.

Ord. Siphonales: Lack of cross-walls in body gives continuous cavity. Typical genus, Vaucheria (pond-scuin, "green felt").

Ord. Conjugales: Forms a complex mass of fused tubes. Typical genus, Spirogyra (1-104), which consists of delicate filaments, found in pond-seum.

Cl. Characeae:

Ord. Charales: "Stoneworts"; grow on bottom of ponds. Thallus has definite points from which branches and reproducing cells originate.

Cl. Rhodophyceae: "Red Algae" (1-105). Some have simple, others have very complicated, structure. Sexual reproduction is highly developed.

Cl. Phaeophyceae: "Brown Algae" (1-104), the big seaweeds (6-526), chiefly marine. Includes Ord. Laminariales, the Kelps; Ord. Fucales, the Bladder Wracks to which Sargassum, the gulf-weed, belongs.

Cl. Cyanophyceae: "Blue-green Algae"; formerly placed in the Sub-phylum Schizomycetes, Cyanophyceae are now regarded as the most primitive class of Algae, and thus included in the Protophyta.

- Sub-ph. FUNGI (3-488). Parasitic and saprophytic forms, lacking chlorophyll. Consist of a mycelium of thread-like filaments (hyphae) which penetrate the food supply and also give rise to the spore-producing parts. Believed by some authorities to be degenerate forms of algae.
 - Cl. Phycomycetes: Hyphae have continuous cavity, cross-walls being formed only in connexion with reproduction. Includes false "mildews" and black moulds.
 - Cl. Ascomycetes: Hyphae divided by cross-walls; spores contained in sacs (asci). Includes morels, truffles, ergot, and true mildews and moulds; also the Yeasts.
 - (I. Basidiomycetes: Spores borne on outgrowth from a cell, or row of cells, called a "basidium"; these are most of the common fungi, the mushrooms and toadstools. Typical examples, Rusts and Smuts, Mushrooms, Toadstools.

Note: The sub-phylum Myxomycetes or Slime Fungi are by some authorities included with the Fungi because they possess spore cases. They do not, however, have the mycelium. The young swarm-cells gather into amoeba-like groups, which leads some biologists to class them as animal.

Sub-ph. SCHIZOMYCETES: Bacteria (1-348). Usually classed with the Fungi. Reproduction by fission and by spores. Read also Germs in Disease (4-14).

Note: The Lichens (4-490) are partnership plants, consisting of a Fungus which imprisons algae, forming a combination that is mutually helpful. Lichens can be made artificially by placing the proper plants together. They are usually classified by means of the Fungus which enters into the combination. For instance, the genera Parinelia and Physia are Ascolichenes, because the Fungus is an Ascomycete.

II. BRYOPHYTA.

Probably evolved from Green Algae and adapted to land life. Characterised by well developed "alternation of generations" in which the gametophyte (plant of the sexual generation) is the commonly visible form.

Cl. Hepaticae: Liverworts (4-526), probably evolved from Algae and ancestors of Mosses; spore case opens by splitting or decay of walls. Cl. Musci: Mosses (5-167); spore case opens by means of a lid or by slits; plant differentiated into primitive stems and leaves.

III. PTERIDOPHYTA.

This group is characterized by the appearance of a Vascular Structure, that is, a system of specialized cells for conducting sap through the plant body. A striking alternation of generations occurs, the femiliar form being the sporophyte (the asexual generation). The gametophyte is a small, simple, green object. The best-known classes are:

- Cl. Equisetales: The "Horsetails." The only living genus is *Equisetum*, stems jointed, leaves grow in whorls, being united in each whorl into a sheath.
- Cl. Lycopodiales: Divided into various orders, the Lycopodiaceae or "Club mosses"

being the typical one. Stems slender, branched, closely covered with small leaves, moss-like in appearance,

Cl. Filicales: Ferns (8-346); fronds bear spores in "sori" or groups on their under surface. Two sub-classes: Filicineae, the true Ferns, such as *Pteris*, Bracken (2-37), and Hydropteridineae, the Water Ferns.

Note: In prehistoric times members of this and other primitive groups formed huge trees, the forests of their day.

IV. SPERMATOPHYTA.

Plants in which fertilisation results in the production of a seed, a resting embryo embedded in the food store. (In the preceding groups the fusion of the gametes does not result in a resting embryo.) There are two main sub-phyla: (1) Gymnosperms; (2) Angiosperms.

Note: Many of the less important families are omitted in the classification below.

Sub-ph. GYMNOSPERMS: "Naked-seeded" plants in which the seed is exposed to the air. This is a very ancient group, going far back in geological time, and showing evident descent from the ferns; its higher members, however, point the way to the Angiosperms. The extant classes are:

Cl. Cycadales: Primitive, fern-like or palm-like forms, confined to the tropics. The single stem bears a few large leaves. Typical genera, Cycas (Asiatic) and Zamia (American). Cl. Ginkgoales: Sole surviving example, the Ginkgo or maidenhaur tree.

Cl. Coniferales: Chief group, the conifera (2-483), found in temperate zones; tall, erect trees, usually evergreen with needle-like leaves.

Fam. Araucariaceae: Male and female cones similar, with numerous pointed scales. Typical genera Araucaria, Monkey Puzzle or Chili Pine (f.-i.); Agathis, Kauri Gum (5-422).

Fam. Podocarpaceae: Small trees and shrubs; cones small. An unimportant group. Fam. Pinaceae: Trees and shrubs. Male cones superficially catkin-like; females consisting of overlapping scales, usually hard. Important genera: Pinus, Pines (6-203); Abies. Fir (8-355); Picea, Spruce (7-189); Tsuga. Hemlock tree (3-356); Pseudotsuga, Douglas Fir (3-356); Larrx, Larch (3-421; 7-314); Cedrus, Cedar (2-285).

Fam. Cupressaceae: Scales fewer than in Pinaceae, leaves often of two types. Typical genera, Cupressus, Cypress (3-20); Taxodium, Deciduous or Swamp Cypress (2-483); Juniperus Juniper (4-386), in which conescales are amalgamated to form a berrylike fruit; Wellingtonia (7-437).

Fam. Taxaceae (Seeds often in fleshy capsules, or with naked ovules. Typical genus. Taxus, Yew (7-513).

Sub-ph. GNETALES (f.-i.). Plants intermediate between the later Coniferous orders and the Angiosperms, possibly the true ancestors of the latter. Examples, Ephedra, Gnetum.

Sub-ph. ANGIOSPERMS (2-24; 6-214; 6-529). The highest plants. Members of this group have true flowers;, seeds are enclosed in seed case. Angiosperms fall into two great classes:

(1) Monocotyledons and (2) Dicotyledons.

Note: The classification of Angiosperms depends chiefly upon the development of and variation in their flowers and, to a slight extent, their leaves. If the flowers, for example, have their parts arranged in a spiral, they are termed "spiral"; but in the higher groups they are often in a series of definite, separate whorls, and are then termed "cyclic." The number of families is very large and only important ones are given below.

Cl. Monocotyledons: Seeds have only one cotyledon; flowers with parts usually arranged in threes; vascular tissue usually scattered through the stems, which have no secondary thickening; leaves are mostly parallel-veined, the main veins being connected by finer veins, while in the leaves of the Dicotyledons there is usually one main vein sending branches to the margin.

Ord. Pandanales: Spiral flowers without perianth; all forms water-loving. Typical example: Fam. Typhaceae, Gen. Typha, Reed Mace (2-123).

Ord. Heliobicae: Water plants; usually cyclic flowers, often enclosed in a spathe.

Fam. Alismaceae: Alisma, Water Plantain; Sagittaria, Arrowhead (2-24); Butomus, Flowering Rush.

Ord. Glumales: Individual flowers protected by bracts or hairs.

Fam. Gramineae: Grass family (4 63), includes most cereal grains. Typical genera: Avena, Oats (5 490); Triticum, Wheat (7-447); Secale, Rye (6 482); Oryza, Rico (6-396); Hordeum, Barley (1-368); Zea, Maize (5 90): Phragmites, Reed; Sorghum; Panicum, Millet; Bambusa, Bamboo (1-359); Saccharum, Sugar-cane (7-183).

Fam. Cyperaceae: Sedges (f.-i.). Distinguished from grasses by solid leaf-sheath enclosing stem. Typical genera: Cyperus, Papyrus Reed; Carex, Common Sedge.

Ord. Palmales: Consists of one family, Palmaceae, the Palms (6 50); rudimentary perianth present: flower cluster sheltered by great bract. Typical genera: Phoenix, Date Palm (6 50); Areca, Betal (5-487); Cocos, Coconut (2 441); Metroxylon, Sago Palm (6-484); Phytelephas, Ivory Palm.

Ord. Arales: Flowers with highly specialised type of bract; broad, net-veined leaves.

Fam. Araceae: Arums. Typical genera: Arum, Arum (3 339); Richardia, Arum Lily (4-507).

Fam. Lemnaceae: Duckwoods (7-429), leafless, whole plant resembling simple frond; form "carpets" on ponds.

Ord. Farinales: Flowers primitive, but often with differentiated calyx and corolla. Fam. Commelinaceae: Spiderworts. Typical genus: Tradescantia, Spiderwort.

Fam. Bromeliaceae: Bromelia family; most types epiphytic: leaves often scaly. Typical genera: *Tillandsia*; *Ananas*, Pincapple (6° 204).

Ord. Lileales: Perianth varies from primitive to petal-like type; root system often a bulb, rhizome, or corm (2-118).

Fam. Liliaceae: Floral elements set below ovaries (hypogynous); regarded as primitive family. Typical genera: Lilium, Lilies (4 506); Allium, Onion (5 511); Garlie, Leek; Asparagus, Asparagus (1-274): Convallaria. Lily of the Valley; Tulipa, Tulip (7-323); Yucca, Yucca; Hyacinthus, Hyacinth (4 213); Ruscus, Butcher's Broom (f.-i.); Scilla, Bluebell (1 496).

Fam. Juncaceae: Rushes (f, \cdot, ι) . Flowers resemble lilies but are clustered; suited to wind pollination; leaves grasshke.

Fam. Dioscoreaceae: Tuber roots, elimbing stems. Typical genus: Dioscorea, Yam (f.-i.); Tumus, Black Bryony (f. i.). Fam. Amaryllidaceae: Floral elements rise from top of ovary (epigynous). Typical genera: Narcissus, Narcissus (5–324). Daffodil (3–25); Galanthus, Snowdrop (7–78); Agave, Agave (1–67); Sisal (7–58).

Fam. Iridaceae: Iris family; most highly specialised family of order Lileales; flowers epigynous. Typical examples: Iris, Iris; Gladiolus (f,-i,), Crocus (2.533); Freesia (f,-i,).

Ord. Scitaminales: Flowers have petal-like stainens; leaf sheaths build up false stein. Fam. Musaceae: Banana family. Typical genus: Musa, Banana (1 359).

Fam. Cannaceae or Scitaminaceae : Canna family. Typical example, Canna.

Fam. Zingiberaceae: Ginger family.
Typical genera: Zingiber, Ginger (4/21, 7-131); Marinta, Arrowroot (f.-i.)

Ord. Orchidales: Most highly specialised order of Monocotyledons.

Fam. Orchidaceae: Orchids (5 529), meluding "air plants" (epiphytes) and normal forms, the latter frequently saprophytic or parasitic. Most flowers have a well-developed labellum, or "hp." Typical genera: Orchis, including many of the best known species: Ophras, insect-mimicking types, such as the becand spider orchids; Lackio cattlega: Cypripedium, Lady's Shipper (4 436): Vanilla, Vanilla (7 381); Sparanthes, Lady's Tresses.

Cl. Dicotyledons: Plants whose seeds contain two cotyledons (6.528). Vascular tissue forms tube or cylinder including central pith; stems show secondary thickening; leaf voins usually end at edge of leaf; flowers have parts in fours or fives.

Note: The Dicotyledons fall into two sub-classes: (1) the Archichlamydeae, in which the flowers are either devoid of corolla (apetalous) or else they have one or several separate petals (polypetalous), and

(2) the Sympetalae, in which the petals are usually fused into a cup or tube at the base (sympetalous). The classification begins with the Archichlamydae; only important families are mentioned.

Ord. Piperales: Primitive form; naked flowers. Typified by family Piperaceae, gonus Piper, Pepper (6-121).

Ord. Salicales: The Willow order with one family a flowers grow on aments or "catkins," comprising numerous simple flowers, each concealed by a horny sheath or bract.

Fam. Salicaceae: Typical genera: Salir, Willow (7 454); Populus, Poplar (6 259).

Ord. Juglandales: The Walnut order, with one family. Flowers in catkins similar to those of willows, but show beginnings of petal and sepal structure; compound leaves.

Fam. Juglandaceae: Flowers monoceous. Typical genera: Juglans, Walnut (7 416); Carya, Hickory; Pecan.

Ord. Fagales: Flowers in catkins similar to those of the Walnut order, but leaves simple. Fum. Fagaceae: Typical genera: Fagus, Beech (1-409); Quercus, Onk (5-489); Custanea, Spanish Chestnut (2-332).

Fam. Betulaceae: Typical genera: Betula, Birch (1-452): Corylus, Hazel (4 143); Alnus, Ander (1 97).

Ord. Urticales: Perianth distinct but bracteate instead of having true petals and sepals; thowers cyclic.

Fam. Urticaceae: Nettle family: alternate leaves. Typical genus: Urtea, Nettle (5 393). Fam. Ulmaceae: Elm family: alternate, simple leaves. Examples: Ulmus, Elm (3 236); Celtes. Lotus or Nettle treo. Fam. Moraceae: Mulberry family. Typical genera: Morus. Mulberry (5 289); Cannabis, Hemp (4 161); Ficus, Fig (3 350); Banyan (1 365); Artocarpus, Breadfrut (2 52); Humulus, Hop (4 192).

Note: All the cathin bearing plants are now often grouped together as Amentiferae.

Ord. Santalales: Flowers cyclic as in the Order Urticules, but ealyx and corolla are differentiated.

Fam. Santalaceae: Typical genus: Santalum, Sandalwood.

Fam. Loranthaceae: Most members tropical and parasitic. Common example? *Viscum*, Mistletoe (5 228).

Ord. Polygonales: Flowers cyclic; permuth segments in threes.

Fam. Polygonaceae: The Dock family Typical genera: Polygonum, Knotgrass; Rumex, Dock; Rheum, Rhubarb (6 396).

Ord. Centrospermales: Transitional forms ranging from bractente flowers of Chenopodiaceae to woll-differentiated perianth of Caryophyllaceae.

Fam. Chenopodiaceae: Goosefoot family. Typical genera: Chenopodium, Goosefoot; Beta, Boot (1 410).

Fam. Caryophyllaceae: Pinks; flowers well developed with ealyx tending to fuse

into tube in some types. Typical genera: Silene, Lychnis, Campions (2 193); Dianthus, Pink (6 205), Carnation (2-244), Sweet William; Stellaria, Statchwort (7-158), Chickword (7-158).

Ord. Ranales: Ranges from primitive types with spiral flowers to well-developed cyclic flowers having true perianth.

Fam. Ranunculaceae: Crowfoot family. Typical genera: Ranunculus, Buttercup (2 135; 3 395): Crowfoot; Inlphinium, Larkspur (4-448); Paconia, Peony, (6 120); Clenatis, Traveller's Joy (2 406); Helleborus, Hellebore, Christmas Rose (f.-i.); Aquilegia, Columbme (f.-i.); Caltha, Marsh Marigold; Aconitum, Monkshood (f.-i.); Anemone (1 150). Fam. Berberidaceae: Typical genus: Berberis, Barberry.

Fam. Nymphaeaceae: Typical genera: Nuphar, Yellow Water Lily; Nymphaea, White Water Laly; Sacred Lotus (7–425). Fam. Magnoliaceae: Magnolia family. Typical genera: Magnolia, Magnolia (5–86); Liriodendron, Tulip Tree (f.-i.). Fam. Myristicaceae: Nutmeg family; tropical trees and shrubs. Typical genus: Myristica, Nutmeg (5–486).

Fam. Lauraceae: Laurel family. Typical genera: Laurus, Bay Laurel (4 455). Cinnamomum, Cinnamom (7-131): Camphor (2 192).

Ord. Rhoeadales: An advance on the Ranales.

Fam. Papaveraceae: The Poppy family, from which the other families may have evolved. Typical genus: Papaver, Poppy (6-259), Opnum (5-521).

Fam. Resedaceae: Typical genus: Reseda, Mignonette (5 202).

Fam. Cruciferae: The Cabbage family (2 151). Typical genera: Brassica, Cabbage, Turnip, Mustard (5 312); Raphanus, Radish (2-151): Nasturtium, notanical name for Watercress (7 428); Capsella, Shepherd's Purse; Iberis, Candytuft (f.-i.); Cardanine, Lady's Smock, Bittercress (2 24); Cheiranthus, Wallflower.

Ord. Sarraceniales: In this order are included several insect-cating plants.

Fam. Sarraceniaceae: American forms. Typical genus: Sarracenia, Pitcher Plants (6 207).

Fam. Nepenthaceae: Assatic forms; putchers at tip of tendrils. Typical genus: Nepenthes, Pitcher Plants (6 207).

Fam. Droseraceae: Leaves exude sticky fluid. Typical genera: Drosera, Sundew (7-190); Dionoca, Venus's Fly-Trap (7-389).

Ord. Rosales: This is the dominant order in the sub-class Archichlamydeae, with more than 14,000 species. The fruits are highly specialised in a large variety of forms Types supposed to have evolved from Buttercup family, Ramunculacous.

Fam. Saxifragaceae; Most primitive types; regarded as ancestors of other families in the order. Typical genera: Saxifraga, Saxifrago (8-501); Hydrangea (4-214); Ribes, Gooseberry (4-47), Cur-

rant (3-12).

Fam, Rosaceae: The Rose family. Typical genera: Spiraea, Spiraea, Meadow Sweet; Alchemilla, Lady's mantle; Rosa, Rose (6-458); Fragaria, Strawberry (7-178); Potentilla, Barren Strawberry; Rubus, Raspberry (6-364); Blackberry (1-477); Loganberry (3-399); Prunus, Apricot (1-186). Sloe, Plum (6-228), Peach (6-99), Cherry (2-327), Cherry Laurel (4-455, 456); Crataegus, Hawthorn (4-142); Pyrus, now usually subdivided into Pyrus (Pear, 6-100), Malus (Apple, 1-185), Sorbus (Rowan, Service, Whitobeam (f.-i.), 1-263); Mespilus, Medlar (6-325); Amygdalus, Almond (1-117); Cydonia, Quince (6-824).

Fam. Leguminosae: Pod-bearing plants; roots often harbour nitrifying bacteria; genus Mimosa is typical of the stock from which other types of Leguminosae evolved. This family is divided into three sub-families according to flower structure.

Sub-fam. Mimosoideae: Tropical and semi-tropical forms; corolla regular. Typical genera: Mimosa, Mimosa, Sensitive Plant (4-470); Acacia, Acacia (1-8).

Sub-fam. Caesalpinioidae: Flower partially "papilionaceous" (butterfly-shaped). Typical genera: Gleditschia, Honey Locust; Tamarindus, Tamarind (3-479); Cercis. Judas Tree (f.-i.). Sub-fam. Papilionoidae: Flower completely papilionaceous. Typical genera: Phaseolus, Bean (1-390); Glycine, Soya Bean (7-103); Pisum, Pea (6-99); Lathyrus, Sweet Pea (6-99); Lens, Lentil (4-482); Arachis, Groundnut (4-98); Trifolium, Clover (2-423), Shanrock (7-15); Melilotus, Sweet Clover (2-423); Medicago, Lucerno (5 48); Astragalus, Milk Vetch, Tragacanth; Glycyrthiza, Liquorice (4-521); Lotus, Bird's-foot Trefoil (5-40); Robinia, Locust, False Acacia; Indigofera, Indigo (5-256); Haema-

Fam. Platanaceae: Typical genus: Platanus, Plane Tree (6-211).

toxylon, Logwood (f.-i.).

Fam. Hamamelidaceae: Typical genus: Hamamelis, Witch-hazel (f.-i.).

Ord. Geraniales: Flowers completely cyclic; carpels tend to fuse into "compound pistils" in higher families.

Fam. Geraniaceae: Geranium family (3-524). Typical genera: Pelargonium, so-called "Geranium"; Geranium, true Geranium.

Fam. Tropacolaceae: Typical genus: Tropacolum, commonly called Nasturtium (5-324).

Fam. Linaceae: Type: Linum, Flax (3-387).

Fam. Meliaceae: Typical genus: Swietenia, Mahogany (5-87).

Fam. Euphorbiaceae: Spurge family. Typical genera: Euphorbia, Spurge (f.-i.); Ricinus, Castor Bean; Hevea, Para Rubber (6-464); Manihot, Cassava, the source of Tapioca (7-226).

Fam. Oxalidaceae: Typical genus:

Oxalis, Oxalis, Wood Sorrel.

Fam. Rutaceae: Typical genus: Citrus, Orange (5-524), Lemon (4-477); Lime, Grapefruit (4-61).

Ord. Sapindales: Flower forms similar to Geraniales; distinguished by structure of ovules.

Fam. Hippocastanaceae: Typical genus: Æsculus, Horse Chestnut (4-197) (by some this family is called Sapindaceae).

Fam. Anacardiaceae: Typical genera: Rhus, Sumach, Lacquer (4-434); Mangifera, Mango (5-113).

Fam. Aceraceae: Maple family. Typical genus: Acer, Maple (5-117), Sycamore (7-215).

Fam. Buxaceae: Type: Buxus, Box (f.-i.). Fam. Aquifoliaceae: Typical genus: Ilex, Holly (4-187).

Ord. Rhamnales: Flowers tetra-cyclic, that is, the parts of the perianth arise from four distinct circles or whorls. Otherwise order resembles Sapindales.

Fam. Rhamnaceae: Buckthorn family. Typical genus: Rhamnus, Buckthorn (f.-i.).

Fam. Vitaceae: Shrubs, climbing vines. Typical genera: Vitis, Grape Vine (4 62); Ampelopsis, Virginia Creeper.

Ord. Malvales: Most types have carpels fused into compound pistil (syncarpous).

Fam. Malvaceae: Mallow family; stamens fused into tube around pistil. Typical genera: Malva, Mallow (5-97); Gossypium, Cotton (2-516); Althaea, Hollyhock (4-187); Eriodendron, Kapok tree (4-393).

Fam. Tiliaceae: Lime family; carpels fused; stamen form variable. Typical genera; *Tilia*, Lime Tree (4-509); *Corchorus*, Jute (4 389).

Fam. Bombacaceae: Silk cottons; seeds covered with silky hairs. Typical genus: Adansonia, Baobab.

Fam. Sterculiaceae: Cola nut family; flowers often have stamens fued. Typical genera: Sterculia, Bottle tree (2-26); Theobroma, Cacao (2-438).

Ord. Parietales: Complex group showing marked relation to Ranales.

Fam. Passifloraceae: Typical genus: Passiflora, Passion Flower.

Fam. Begoniaceae: Typical genus: Begonia, Begonia (1-416).

Fam. Theaceae: the Tea family. Typical genera: Thea, Tea (7.232); Camellia, Camella (2-189).

Fam. Violaceae: Violet family. Typical genus: Viola, Violet (7-401), Pansy

Ord. Opuntiales: The Cactus order (2-157). Contains one family, Cactaceae. genera: Cereus, Opuntia, Echinocactus.

Ord. Myrtales: Stamens always cyclic; some

perigynous, some epigynous.

Fam. Myrtaceae: Myrtle family. Typical genera: Myrtus, Myrtle; Eucalyptus, Encalyptus (8-809); Eugenia, Pimento and Clove (2 423).

Fam. Onagraceae: Typical genera: Epilobium, Willow-herb (f.-i.; 3-399 illus.); Euchsia, Fuchsia (8-485).

Fam. Punicaceae: Typical Punica, Pomegranate (6-256).

Fam. Rhizophoraceae: Typical genus: Rhizophora, Mangrove (5-113).

Ord. Umbellales: Most highly developed forms in the sub-class Archichlamydeae. Stamens always cyclic. Flowers epigynous. Fam. Araliaceae: Typical genus: Hedera, Ivy (4-332).

Fam. Cornaceae: Typical genus: Cornus,

Dogwood (f.-i.).

Fam. Umbelliferae: The Parsley family; flowers usually very small and numerous, in umbrella-shaped clusters (umbels). Typical genera: Apium, Celery (2-286); Peucedanum, Parsnip (6-93); Daucus, ('arrot (f.-i.); Conium, Hemlock (poisonous herb) (4-161).

Note: This point marks the end of the sub-class Archichlamydeae and the beginning of the sub-class Sympetalae, in which the petals are fused into a

more or less tubular corolla.

Ord. Ericales: Most primitive of Sympetalae. Fam. Ericaceae: Heath family (f.-i.). Typical genera: Erica, Heath (4-148), Calluna, Heather (4-148); Vaccinium, Cranberry, Bilberry (1-445); Azalea (1-830); Arbutus, Strawberry Tree (1-201); Rhododendron (6-895).

Ord. Primulales: Single cycle of stamens, opposite petals; seed-supporting structure

free " inside ovary.

Fam. Primulaceae: Primrose family. Typical genera: Primula, Primrose (6-287), Cowslip (2-523); Lysimachia, Yellow Loosestrife, Pimpernel (Poor Man's Weather Glass) (f.-i.); Cyclamen

Ord. Ebenales: Members show both primitive polypetalous forms and advanced

epigynous characteristics.

Fam. Ebenaceae: Ebony family. Typical genus: Diospyros, Ebony (3-156), Persimmon.

Fam. Sapotaceae: Sapodilla family. Typical genera: Chrysophyllum, Star Apple (8-479); Sapota, Sapodilla; Palaquium, Gutta-percha Tree (4-108).

Ord. Gentianales: Flowers stable in type, usually with five petals and stamens, and two carpels; corolla twisted in bud.

Fam. Gentianaceae: Gentian family. Typical genus: Gentiana, Gentian (8-513). Fain. Olcaceae : Olive family ; leaves often leathery; some types produce flowers in Typical genera: Olea, Olive clusters. **(5–507)**; Ligustrum, Privet; Syringa, Lilac (4-506); Jasminum, Jasmine (4-354); Fravinus, Ash (1-263)

Fam. Loganiaceae: Typical genera: Strychnos, S. nux vomica; Gelsemium,

Yellow or Carolina Jasmine.

Fam. Apocynaceae: Dogbane or Periwinkle family. Highly evolved, except that carpels are distinct. Typical genera. Nerium, Oleander; Vinca, Periwinkle.

Ord. Polemoniales: Flowers symmetrical with several planes of symmetry.

Fam. Polemoniaceae: Typical genus:

Phlox (6-160).

Fam. Convolvulaceae: Twining, climbing plants. Typical genera: Ipomaea, Morning Glory; Convolvulus (2-494); Cuscuta, Dodder (5-444).

Ord. Boraginales: Types tend to evolve lobed ovary, resulting in four-part form.

Fam. Boraginaceae: Borage family; monibers usually have hairy stems. Typical genera: Myosotis, Forget-me-not (3 422); Heliotropium, Heliotrope (f.-i.).

Ord. Labiatales Flower forms tend to develop about one axis of symmetry.

Fam. Lentibulariaceae: Insect-eating. marsh-loving plants. Typical genera: Utriculuria, Bladderwort (6-218, 217 illus.); Pinguicula, Butterwort (5-444; 6-218 illus.).

Fam. Verbenaceae: The more primitive forms. Typical genera: Verbena; Tectona, Teak (7-235).

Fam. Labiatae: Most of the garden herbs belong to this family (7-272). Typical genera: Mentha, Mint (5-222); Nepeta, Ground Ivy (f.-1.); Lamium, Dead Nettle (5 393); Thymus, Thyme (7-272); Lavandula, Lavender (4-456).

Ord. Personales: Flowers highly zygomorplus (developed about one axis of symmetry).

Fam. Solanaceae: Nightshade (5-439) family; members frequently poisonous. Typical genera: Solanum, Nightshade, Potato (6-273), Bittersweet (1-477); Nicotiana, Tobacco (7-286); Capsicum, Cayenne Pepper (6-121); Atropa, Atropine, Belladonna, or Deadly Nightshade 6-236); Petunia. Petunia ; (5-439;

Lycopersicum, Tomato (7-290).
Fam. Bignoniaceae: Trees and woody climbers; flowers often irregular. Typical genus: Catalpa, Catalpa, Indian Bean. Fam. Scrophulariaceae : Figwort family ; fruit two-celled, many-seeded capsule. Contains more than 2,000 species. Typical examples: Linaria, Toadflax (f.-i.); Digitalis, Foxglove; Calceolaria; Scrophularia, Figwort (f.-i.); Verbascum, Mullein $(f.\cdot i.)$.

Fam. Orobanchaceae: Brown or whitish, leafless, parasitic plants, flowers lipped. genera : Orobanche, Broom-Typical rape; Lathraea, Toothwort.

BOTANY-CHEMISTRY

Ord. Rubiales: Anthers usually distinct; flowers epigynous.

Fam. Rubiaceae: Madder family; opposite or whorled leaves with interposed stipules. Typical genera: Cinchona, Quinine (6-325); Coffea, Coffee (2 444); Gardenia, Gardenia (f.-i.).

Fam. Caprifoliaceae: Honeysuckle family: flat-topped flower clusters. Typical genera: Sambucus, Elder (3 207): Lonicera, Honeysuckle (4 190).

Fam. Dipsaceae: Typical genera: Dipsucus, Tensel (7 235): Scabiosa, Scabious (f.-i.).

Ord. Campanulales: Contains highest forms of Angiosperius. Anthers often converge or fuse; more than 14,500 species in order.

Fam. Campanulaceae: Primitive stock of this order. Typical genus: Campanula, Harchell (1 494; 2 24 dlus.); Canterbury Bell (f.-i.), Bellflower (f.-i.). Fam. Cucurbitaceae: The Gourd and Melon family. Typical genera: Cucurbita, Marrow (5-135), Squash, Pumpkin (6-307); Cucumis, Musk Melon, Cantaloup (5-167), Cucumber (3-9); Citrullus, Water Melon (5-167); Lagenaria, Gourds (f.-i.); Bryonia, Bryony (f.-i.).

Note: The family Cucurbitaceae is sometimes placed in a separate order, Cucurbitales.

Fam. Compositae: The Compositae, dominant and most highly evolved family of plants, contain more than 12,500 species. Characterised by "compound" inflorescences; seeds usually wind borne on "parachute." Regarded as the highest type known. Typical genera: Aster (1-277); Chrysanthonum (2 384): Artichoke Helianthus, • Jerusalem (1-257), Sunflower (7 190); Taraxacum, Dandelion (3 40); Lactuca, Lettuce (f.-i.); Cichorium, Cheory (f.-i.) and Endive (f.-i.); Dahlia, Dahlia (3 25); Carduus and Cnicus. Thistles (7 270); Tussilago, Colt's-foot (f.-i.); Bellis, Daisy (3 27); Anthemis, Camomile (2 190); Calendula, Marigold (5-126); Centaurea. Cornflower (2 507), Knapweed; Cynara, Globe Artichoke (1-257). The Compositao are often divided into Tubuliflorae, which have a composite ileral head made up of small tubular flowers usually surrounded by large "ray" flowers, with conspicuous permuth, and Liguliflorae. whose floral head is composed entirely of ray flowers.

CHEMISTRY

IT is not possible to draw a sharp line of distinction between physics and chemistry; but in the main those properties and processes which are explained by the arrangement and rearrangement of atoms in molecules are considered as belonging to chemistry; the rest to physics. A considerable area common to both subjects is sometimes referred to as physical chemistry.

I. GENERAL PRINCIPLES.

A. Basic Conceptions and Definitions.

- a. Elements. Those substances which, it has been found by long experience, cannot be broken down into simpler substances are called elements (2-316). There are at least minety natural elements; and at least eight more which have been made artificially (3-224).
- b. Atoms. All atoms of any given element have the same number of protons in the nucleus, and when complete an equal number of electrons surrounding it (1-298). On these electrons, and more particularly those in the outer shell, the chemical properties of the elements depend (2-318).
- c. Molecules. Groups of atoms tend to ching together as molecules (2-317). A substance whose molecules are all alike is called a pure substance, and if there is more than one kind of atom in the molecules, it is a chemical compound.
- d. Isomers. Substances whose molecules contain the same kinds of atoms in the same numbers, but differ only in their arrangement, are called chemical isomers (2-321).

- e. Radicles. Groups of atoms which during chemical changes appear to pass from one molecule to another unaltered, almost as though they were single atoms, are called radicles or radicals. In practice it is rare (though not impossible) to find a radicle existing by itself: it is almost always found in combination (2–318)
- f. Valency. The basic principles of molecular arrangement are embodied in the theory of valency. In its early form the valency of an atom was defined as its capacity to combine with other atoms, and pictured as a set of hooks engaging one to one with similar hooks on other atoms. Later, valency was explained in terms of the electrons in the outer shell (called the valency electrons) (2–317).
- g. Bonds. Three types of bonds binding atoms together in molecules and crystals are distinguished: polar, ionic, or electrovalent bonds; covalent bonds; and coordinate linkages. In some circumstances double or even triple bonds may be formed between two atoms (2 318).
- h. Shapes of Molecules. In general the bonds to any atom tend to keep as far away from each other as possible. This, with the relative

sizes of the atoms concerned, determines the shape of the molecule; and the shape of the molecule determines many of the physical properties of the substance (2–318)

- 1 Mixtures Chemical compounds are distinguished from mechanical mixtures in which small grains or even inolocules of different substances are jumbled together, the molecules themselves remaining distinct I has a mixture of oxygen and hydrogen gas differs greatly from the themselve compound water (7 424).
- J Colloids When very small particles of one substance are distributed evenly through a fluid medium the result is a colloid, which has special properties different from the colm ordinary solid liquid, or gas (2.455)
- k Solutions In a solution, the individual molecules of one substance the solute are listributed evenly through a me hum when is usually liquid and as called the solvent (2-322). There are also solid solution, chiefly a partant in metallulgy (1-115).
- 1 Electrolytes In many liquid that in some or all of the molecules of the three split up into two parts in such a way that one has more, the other less, than its in rial complement of classical and is called an ion (4.276) the process is all dissolution and ibstances which has a rate in the function of (3.220).
- B Analysis and Synthesis. These represent the two department into which both argum and morganic chemistry and to divide in practice. Analysis is the braham I word morganism state of this over what elements they centain (qualitative malysis) and in what proportions (quantitative malysis). Synthesis is the building up for epined substances at a formpler material Chemicals which are them else mode by synthesis but the chiefly used as a statum, point for the synthesis of even in a complete materials are called intermediates (2, 324).
- C Chemical Reactions A chemical reaction occurs whenever the atoms in the molecules of one or more inbetances become rearranged. The original molecules may be split up or two crimoro may join together or any combination of these two processes may occur (2-322). Well-known example are burning or combustion (3-35"), the reaction of an acid with either a base or a metal to form a silt (1-11). Chemical reactions take place more readily when one or more of the substances concerned are in liquid or gaseous form. They can also be promoted by heat, light, electricity, and other forms of energy (2-322).
 - a. Conservation of Mass In any chemical reaction, the total mass of the substances produced will equal the total mass of the ingredients (2 317)
 - b. Conservation of Energy In general, a chemical reaction will either release or absorb energy—usually in the form of heat, some

times of light electricity etc. In every reaction the amount of heat or other energy absorbed or emitted will be exactly balanced by the imount of chemical energy gained or lost (2-323). A great deal has been learned about chemical rections by applying in detail the principles of thermodynamics to the energy changes involved (2-324).

c Catalysts Many chemical reactions are issisted by the presence of other substances, called a dista. These remain unaltered however long the reaction continues. They make no differ nee to the energy balance, but they enable the reaction to take place much nor quickly. They are of great importance both in the chemical industry, and in the functioning of living organisms (2–322).

D The Language of Chemistry

- a Symbols and Formulae Prety element has a symbol which is either a single capital letter or one capital and one small letter. In the (in I culti) formula for any compound, the number of atoms of each element is the mole of is written as a subscript rater its symbol eg Sugar (12H25011 (2317) Graphic and structural formulae are more claberate indicate insect the arrangement of the at ms in space (2319).
- b Equations Chemical equations are advice for representing reactions simply on paper. They enable a chold to be made to see that the same atoms are represented on both sides of the arrow to agree with the conservation of matter (1.11).
- c Nomenclature. In the name of a compound ntuming only two elements, the mains of the man electropistive is placed first the ther following with the uffix le 17 schin i bloride NaCl (6 490). Where two or more sure compounds exist, they may be distinguish the Greek numerical prefixes eq cubon monoxide (O) (2, 220), cubon di xide (1) (2 219), boron tri hbuth BCl 2 319), curb in tetrachloride (Cla (used for cleaning clothe and more generally as an industrial solvent) phosphorus pentoxide P2O (used for drying gises) uranium hexafluctide UF. cused in the separation of uranium 235 from uranium 238) The suffix at indicates the presence also of oxygen in the compound of s innecationate or washing soda Na CO (1 111) solum chlorate NiClO3 (a powerful weed kill r) Where there me two such comjounds the on with less oxygen is dis tinguished by the suffix the eq potassium sulphate K SO4 pota sum sulphate K2SO4 Where metals have more than one valency compounds resulting from the higher valence are distinguished by the suffix ic, those result ing from the lower valency by the suffix us c q ferre oxide (the pigment), Fe O₃, terrous oxide l'eO, mecurie chloride or corrosive sublimate HgCl2, mercurous chloride er calomel, HgCl

In organic chemistry the names of hydrocarbons in the paratim series usually end in

-ane, of olefins in -ene, of acetylenes in -yne, of saturated aromatic hydrocarbons in -ene; alcohols often end in -ol, aldehydes in -al, ketones in -one, radicles in -yl, etc. The prefixes n- (for normal), iso-, and neo- in aliphatic compounds indicate straight, single-branches, and double-branched chains respectively.

II. PHYSICAL CHEMISTRY.

- A. States of Matter. These are usually given as solid, liquid, and gas, though colloids are sometimes taken as constituting a fourth state. See Study-Outline of Physics and references there.
 - a. Gas Laws. These are dealt with in the Physics Study Outline, and in the article on Gases (8-508).
 - b. Critical Temperature. For every gas there is a critical temperature below which the gas can be liquefied merely by pressure, but above which no amount of mere pressure will produce liquefaction. A gas below its critical temperature is, strictly speaking, a vapour.
 - c. Vapour Pressure. All liquids with a free surface will give off a small amount of vapour. If they are in an enclosed space, evaporation will continue till the vapour reaches a certain pressure, which is characteristic of the liquid at any given temperature and increases with temperature. When the vapour pressure of an unenclosed liquid becomes greater than atmospheric pressure, the liquid bools.
 - d. Phase Rule. In mixtures of solids, liquids, and gases, a phase is defined as any part of the system which is homogeneous in itself and separated off from any other part; the components of the system are the chemically distinct substances of which it is composed. Thus, in a mixture of ice and water there is one component (H_zO) , but two phases; in a mixture of oxygen and nitrogen there is one phase (gaseous), but two components.

phase (gaseous), but two components. The phase rule, first enunciated by the American mathematical physicist J. Willard Gibbs in 1876, states that in a system with P phases and G components, P+F=C+2, where F is the number of degrees of freedom, i.e. the number of factors (temperature, pressure, concentration, etc.) that can be varied independently without altering the number of phases. This rule has very wide applications and is of immense importance in metallurgy for predicting the structure of alloys, and in the chemical industry generally.

B. Atomic and Molecular Weights.

a. Atomic Weight. The weights of atoms of different elements were first determined in terms of an atom of hydrogen which was taken as 1. Later it was found more convenient to determine atomic weights by reference to oxygen, the average weight of 1 atom of oxygen being taken as exactly 16. On this scale (called the chemical scale) the weight of a hydrogen atom works out at 1.0080; atomic weights on this scale for all except the rarest elements were agreed by an

international committee in 1941 and 1948 and are given in the Periodic Table (8-224).

With the discovery that ordinary oxygen, though consisting chiefly of atoms with a mass number of 16, has nevertheless 0.2 per cent of atoms with mass number 18, a new scale called the physical scale has been introduced in which pure oxygen-16 is taken as having an atomic weight of 16. On this scale the mean atomic weight of natural hydrogen is 1.0088; of pure hydrogen without deuterium, 1.0081.

b. Molecular Weight. This is the sum of the atomic weights of all atoms in a molecule (chemical scale).

III. INORGANIC CHEMISTRY.

- A. Periodic Table. If the elements are arranged in order of their atomic weights, a similarity of chemical properties turns up at regular intervals, or periods, down the list. Thus a table can be devised in which elements with similar properties fall under each other in columns or groups. One form of this table is given in 3-224. In other forms the transition elements are doubled up under the main groups, so that the column headed by scandium is reckoned a sub-group of group 3, those headed by titanium, vanadium, chromium, manganese, copper, and zinc of groups 4, 5, 6, 7, 1, and 2 respectively. This leaves only the three columns headed by iron, cobalt, and nickel as transition elements either under group 0 or forming a new group 8.
 - a. Group 0 contains the inert gases helium (4-160), neon (5-366), argon, krypton, xenon, and radon (6-357). These have their outer shell of electrons complete with 2 (helium) or 8 electrons. They have thus no valency electrons, and are almost incapable of chemical combination.
 - b. Group 1 contains the alkali metals lithium, sodium (7-82), potassium (6-272), rubidium, caesium, and francium in one sub-group; and the coinage metals copper (2-502), silver (7-56), and gold (4-38) in the other. The former combine readily with oxygen and tarnish quickly, the latter are comparatively resistant in air. All have one electron in the outer shell and valency 1.
 - c. Group 2 contains the alkalı earth metals beryllium, magnesium (5–81), calcium (2–166), strontium, barium (7–507), and radium (6–352) in one sub-group; zind (7–523), cadmium (8–224), and mercury (5–173) in the other. They all have two electrons in the outer shell and valency 2; but mercury forms two series of salts, the mercurous salts with valency 2 and the mercuric salts with valency 1.
 - d. Group 8 contains the non-metal boron, besides aluminium (1-127), gallium, indium, and thallium in one sub-group; and scandium, yttrium, the "rare earth" metals or lanthanides (7-259), and actinium in the other. They have three electrons in the outer shell and the valency is usually (but not always) 3. e. Group 4 contains carbon (2-219) and silicon (7-53), which are non-metals, germanium

- (3-225), tin (7-280), and lead (4-463) in one sub-group; titanium (7-282), zirconium (7-523), and hafnium in the other. There are four electrons in the outer shell and the valency is usually 4, though sometimes 2.
- f. Group 5 contains nitrogen (5-443) and phosphorus (6-162), which are non-metals, arsenic (6-236), which is on the border line, antimony (1-175), and bismuth (1-475) in one sub-group; vanadium (7-378), niobium (7-224), and tantalum (7-224) in the other. They have five electrons in the outer shell and the valency is 3 or 5.
- g. Group 6 contains oxygen (6-22) and sulphur (7-186), which are non-metals, the semi-metal selenium (6-530), and the metals tellurium (7-255) and polonium (6-351) in one sub-group; chromium (2-382), molybdenum, and tungsten (7-324) in the other. There are six electrons in the outer shell; the valency is occasionally 6, frequently 2, sometimes 3 or 4.
- h. Group 7 contains the halogens (4-120) fluorine, chlorine (2-377), bromine, iodine, and astatine in one sub-group: manganese (5-112), tecnetium and rhemum in the other. There are seven electrons in the outer shell; the valency is usually I, though it can be anything up to 7.
- i. Group 8 contains three triads of transitional metals: iron (4 288), cobalt (2 434) and nickel (5-432): ruthenium, rhodium, and palladium; osmum, iridum, and platinum (6 221). The last six are often lumped together as the platinum metals. Valencies vary from 1 to 8, but 2, 3, 4, and 6 are the most common.
- j. Hydrogen. Since hydrogen has one electron in its outer shell, it is sometimes included in group 1. Since, however, the first shell round the nucleus is complete with two electrons, hydrogen has one electron short of a complete outer shell, and from this point of view has affinities with group 7. It is non-metallic with a valency of 1 (4-221).
- k. Actinides. It is thought that the artificial trans-uranian elements, neptunium, plutonium, americium, curium, berkelium, and californium, probably belong to a second "rare earth" group, though there is some doubt about where this group begins. On the assumption that like the lanthanides all its members have three electrons in the outer shell, they are sometimes referred to as actinides, and taken as including also thorium, protactinium, and uranium (7-370).

B. Types of Compound.

a. Acids. A large class of chemical substances usually sour to the taste (Lat. acidus, sharp) and tending to corrode metals. Defined technically as substances which when dissolved release hydrogen ions (1-11). The strength of an acid (pH) is measured in terms of the concentration of hydrogen ions (1-12). Well-known inorganic acids are:

- hydrochloric acid (4 215), nitric acid (5-442), and sulphuric acid (7-187).
- b. Bases. These can be defined as substances which when dissolved release hydroxyl ions. The large majority are oxides or hydroxides of alkaline or alkaline earth metals, but the metal may be replaced by a radicle (1-12).
- c. Alkalis. The term alkali is loosely applied to certain common bases, of which soda, potash, and ammonia are best known (1-111).
- d. Salts. Substances formed by reaction of a base or a metal with an acid so that one or more free hydrogen atoms of the acid are replaced by a metal or a basic radicle (1-11).

IV. ORGANIC CHEMISTRY.

This branch began as the study of those chemical compounds (called organic compounds) which go to make up living tissues or which are produced by living processes. In such compounds the molecules are built on a skeleton of carbon atoms, which join up with themselves in an enormous variety of elaborate patterns. Since the discovery that organic compounds could be made artificially. organic chemistry is no longer confined to living processes and products. On the one hand a large branch is concerned with the synthesis of oils, drugs, dyes, plastics, etc., from simple (often inorganic) materials; on the other hand a branch more intimately concerned with the chemical changes accompanying biological processes has been separated off under the name of biochemistry.

A. Organic Molecules.

- a. Chains and Rings. Aliphatic compounds have the carbon atoms strung in open chains, and these may be either branched or unbranched. Cyclic compounds have the carbon atoms arranged in rings. In aromatic compounds the ring (called the benzene ring) has six carbon atoms sharing nine bonds, which thus occupy 18 out of the available 24 valency electrons (2 319). In alicyclic compounds there are fewer than nine bonds distributed round the ring and the properties are more aliphatic than aromatic. Polycyclic compounds have more than one ring condensed into a network. In heterocyclic compounds, one or more of the carbon atoms in the skeleton may be replaced by some other element (e.g. nitrogen, oxygen, sulphur). This frequently leads to five-atom instead of six-atom rings. Four-atom rings, and rings with more than six atoms, are also known. Many of the substances found in plant and animal tissues have molecules of extremely complicated structure (2-321), the most complicated of all being the proteins on which all living processes seem to depend (6-297).
- b. Hydrocarbons. The basic patterns are seen most clearly in the hydrocarbons, which have only hydrogen atoms attached to the carbon skeleton.

Aliphatic hydrocarbons include the paraffin series, $C_n H_{2n+2}$; the olefin series, $C_n H_{2n}$; and the acetylene series, $C_n H_{2n-2}$.

CHEMISTRY-ELECTRICITY AND MAGNETISM

Aromatic hydrocarbons include benzene C_6 H_6 , with one ring; naphthalene, C_{10} H_8 , with two rings; anthracene, C_{14} H_{10} , with three rings, etc. (2–319).

c. Carbohydrates. These are compounds of carbon, hydrogen, and oxygen only, and include the sugars (7-183), starch (7-149), and cellulose (2 287).

B. Organic Reactions.

- a. Substitution. This, in theory at least, is the most important of all organic reactions. It involves the replacement of one or more atoms in the basic hydrocarbon pattern by other atoms or groups of atoms. The process gives rise to such whole classes of organic compounds as alcohols, aldehydes, acids, esters, ketones, phenols, ammes, amides (2-321).
- b. Oxidation. Adding oxygen to a molecule, together with any further changes which take place in consequence. Adding chlorine or removing hydrogen may be counted as equivalent.
- c. Reduction. The opposite of oxidation, which may be brought about by removing

- oxygen, by adding hydrogen, and by other means. Hydrogenation is reduction by direct union with gaseous hydrogen (4-222).
- d. Condensation. The joining of two molecules together with the elumination of some simpler substance (e.g. water or alcohol) in the process.
- e. Polymerisation. Making comparatively small molecules join up with themselves to produce large chains or networks, as in the manufacture of plastics (6 219).

V. CHEMICAL INDUSTRIES.

These include the heavy chemical industries producing alkalis (2–324), hime (4–508), and cement (2–288), sulphuric acid (7–187), by drochloric acid (4–215), chlorine (2–377), etc., the newer large-scale chemical industries producing synthetic ammonia (1–140), nitric acid (5–422), nitrates (5–444), and explosives (3–328); petroleum refining and the production of petroleum chemicals (6–147), fine chemicals, including dyes (3–141), drugs (3–127), and other coal-tar products (2–433); distilling (3–94); the manufacture of soap (7–78), fats (5–506), waxes (7–432), detergents (3–78), and plastics (6–219).

ELECTRICITY and MAGNETISM

ELECTRICITY and magnetism are probably the two most important practical applications of the physical sciences, and they are of ever increasing importance in industrial, scientific, and domestic life. Both are exact sciences with laws that can be expressed as mathematical formulae, but there is no sharp line dividing them, and phenomena of one very often explain phenomena of the other. Because of the many principles involved, it is possible here to present only a brief survey of the primary points, practical aspects are covered in many of the articles referred to in this Study Outline.

I. NATURE OF ELECTRICITY.

An electric current is a flow of electrons (3 221) from a negatively charged source to a positive body. Owing to the use of the early convention of the "one-fluid" theory (3-211), practical electrical science is based on the rule that an electric current flows from positive to negative. This apparent contradiction is retained for reasons of practical convenience. Electricity is said therefore to flow from a point of high potential towards a point of low potential (3-212)—that is, from positive to negative (+ to).

II. PROPERTIES OF ELECTRIC CHARGES.

A. Static Electricity, or Electricity at Rest. An electric charge or current is the result of converting some other kind of energy (e.g. heat, chemical energy, energy of moving water) into electrical energy. "Static" charges can be produced by friction (e.g. by rubbing a stack of sealing wax with a piece of dry flannel); a negative charge then appears on the sealing wax (3-210) but, as a charge of one "sign" (+ or —) cannot be induced without also creating a charge of opposite sign, an equal positive charge appears on the flannel, though this is soon dissipated. Rubbing a glass rod with a piece of silk usually induces a positive

charge on the rod. Free electrons travel readily in certain classes of substances, particularly the metals, these substances are called conductors. It is difficult to create charge, by rubbing two conductors together, because the charges immediately tend to lenk away. Frictional charges are best created upon non-conducting substances, called insulators. These terms are relative; it is best to regard an insulator as a substance having very poor conducting powers.

- B. Attraction, Repulsion, and Polarity. The mutual behaviour of electric charges is summed up in the simple rule, "like attracts unlike, and repels like" (3-214). The sign of a charge (or) is its polarity.
- C. Induction across Space. A charged body upsets the balance between positive and negative charges in neighbouring bodies. A positively charged body placed close to the end of an insulated rod will attract electrons to the nearer end of the rod, leaving a negative charge at the other end (3 214). When the positively charged body inducing the potential is removed, these effects disappear.
- D. Potential. When a point is said to be at a certain potential it means there is a potential electrical difference between the point and

ELECTRICITY AND MAGNETISM

- earth. Potential is similar to pressure and is measured in volts. It causes a movement of electricity from a point where it is higher to a point where it is lower. Difference between the potential at two points produces electric current between them. The "pressure" or electromotive force (e.m.f.) inducing the charge is the potential difference (p.d.) between the areas. If the potentials are of opposite sign, the e.m.f. is the sum of the potentials. The strength of a static charge can be measured by an electroscope (3 216).
- E. Electrostatic Capacity. A considerable number of free electrons can be accommodated between the molecules of certain substances, without any great change in the potential of the substance. In other substances, the addition of a few electrons produces a marked difference of potential. This relation between the amount of chargethat is, the quantity of electrons absorbed and the resulting change in potential is the capacitance or capacity of the substance (3 215).
- F. Capacitors. If an insulated body, such as a metal plate, be charged and another plate which is connected to the earth be brought near it, the capacitance of the first plate for holding electricity is increased. Such a device, which can consist of many plates separated by insulators, is called a capacitic or condenser (3-215), and is used in many practical ways where it is desired to accumulate electric charges.
 - a. Effect of Intervening Insulator or Dielectric. Experiments show that the potential caused by the presence of the charges occurs on the surfaces of the intervening insulator or dielectric. When the strain becomes more than the dielectric can bear, a spark passes, and the charges unite. The capacitance of a capacitor, therefore, depends upon the dielectric's ability to withstand electric stress.
 - b. Leyden Jars. One of the earliest forms of capacitor is the Leyden jar (f. i.), used in the early days of radio transmission.

III. MOVING CHARGES ELECTRIC CURRENTS.

A. Nature. An electric current is a flow of electrons along a conductor. Such a flow is set up by discharging a capacitor, but is over almost instantly. In order to have a steady current. there must be some means for creating a charge, or potential difference, as rapidly as the flowing electrons carry the charge away. Such a current can be produced by electro-chemical means; the dissolving of a metal electrode by an electrolyte m a cell (1-386); or by an electro-thermal process, in which heat energy is transformed (as in a thermocouple, when the junction of two dissimilar motals is heated); or by electromagnetic induction, as in the dynamo and alternator (8–142). Dynamos and alternators can be driven by a prime mover such as a steam engine or an internal combustion engine; or even by a machine which is rotated by pedals operated as in some bicycle lighting sets. Water power can be used to drive water turbines (hydro-electric installations, 4 127), and so to rotate dynamos or alternators.

- B. Creation of Currents by Chemical Means. The first and simplest means of creating a galvanic current is by the chemical energy of a so-called voltaic cell (1-386).
 - a. Voltaic Cells. A familiar example is the Leclanché cell (1-386). The electrodes here are a zinc rod or cylinder, and a carbon rod; the electrolyte is a solution of ammonium chloride. The Leclanché is the common "wet cell." In the common "dry cell" a moist packing is substituted for the watery solution. In other types of cell the electrodes may be two metal rods or plates (e.g. Daniell cell, zinc and copper), with sulphuric acid as the electrolyte.
 - b. Storage Batteries, or Accumulators (1-387). These depend upon the alteration in chemical composition of the metallic plates when the cell is slowly charged from a source of electric current; after charging, and upon connexion to an external circuit, the chemical process reverses, and chemical energy is then transformed into electric energy. In the lead-acid storage battery (1-387) the plates are grids of lead, filled with a paste of red lead (positive plate) and litharge (negative plate); the electrolyte is sulphuric acid diluted with water. In another type (nickel-iron cell), the active materials are nickel exide and iron oxide, with potassium hydroxide as the electrolyte.
 - c. Polarisation. In the simple voltaic cell, the chemical action gradually accumulates hydrogen upon the carbon plate. When a certain amount has accumulated, it blocks further action, and current output ceases. This blocking is called polarisation, and is prevented by using chemicals, such as manganese dioxide, to remove the hydrogen (1-387).
- C. Creation of Currents by Irradiation. The thermocouple (see A, left) can be heated by the radiation from a hot body, and the electric current so produced can be measured to determine the amount of radiation. Another method (6-163) of producing electricity is to allow light to fall upon a photo-sensitive substance (e.g. iron coated with a selenium compound, in contact with a thin film of silver). Only a tiny current is thus produced. The main types of photo electric cells are those in which the shining of a light upon the sensitive surface lessens electrical resistance (c.g. selenium), or acts as a "valve" in causing an electron flow from the sensitive surface in proportion to the amount of illumination (e.g. photocell sensitized with caesium and silver).
- D. Creation of Currents by Mechanical Means. Usually when traced back these devices depend upon heat engines. But the hydro-electric generator and pedal-operated machines mentioned under A (on left) are purely mechanical devices.
- E. Creation of Currents by Contraction and Expansion of Crystals. This phenomenon is called Piczo-electricity (6-196).

IV. LAWS OF DIRECT CURRENTS.

A. Direct and Alternating Currents (3-142). A current may flow steadily in one direction, as it

ELECTRICITY AND MAGNETISM

does from a voltaic cell, as or it is delivered from the commutator of a dynamo (3-142). Or it may reverse direction periodically—many times per second, as does current delivered by an alternator; a given point will then be negative at one instant, and positive at another instant (3-143). The first type is a direct current (D.C.) and the second is an alternating current (A.C.). Alternating currents are created by electro-magnetic induction.

- B. Attributes of a Direct Current. The characteristics of a direct current are determined by the following elements: the quantity of current (symbol I), measured in amperes; the pressure (symbol V), which drives the current, measured in volts; and the resistance which the current encounters (symbol R), measured in ohms. The pressure is the "potential difference" between the terminals of the generating unit supplying the current. It is usually called the electromotive force (e.m.f.). The power of the current depends upon both the quantity of current and the pressure under which it flows, and the product of the voltage and the current. Power is measured in watts (3-210).
- C. Ohm's Law. The relation between potential (pressure), current, and resistance is expressed by Ohm's Law (3-211): that the current in a circuit is equal to the voltage (V) divided by the resistance (R). Thus I V/R.
- D. Divided Currents. When a current passes through one element after another in a circuit as when it passes through a number of lamps (3-212)—the elements are said to be connected in series. When branches divide the circuit and send a part of the current through each element, the elements are said to be connected in parallel (3-212).
- E. Measurement of Current (3-216). Electric currents are measured by means of instruments of various kinds and types. Resistance (ohms) is measured by Ohmeters. Those which measure amperes (current) are called Ammeters, and those which measure volts (pressure) are called Voltmeters.

V. MAGNETISM: NATURAL MAGNETS.

The accepted theory of magnetic domains explains the properties of magnets as being due to the symmetric arrangement of molecular magnets within the body.

- A. Polarity. The north-and-south-pole phenomenon in magnets is explained in 5-82 and in the article on the Compass (2-474). The magnetised needle of a compass, placed at any point in the earth's magnetic field, aligns itself with that field to point towards the magnetic pole (5-83). The article on the Compass also explains what is meant by magnetic deviation, and by variation.
- B. Magnetic Dip. A magnetic needle so mounted as to be able to move freely in all directions will be found, if observed anywhere but on the magnetic equator or "aclinic" line, to dip at one end. The angle thus made with the horizontal is called the inclination or magnetic dip.

- C. Magnetic Substances and Magnetic Penetration. Substances which can be magnetised either temporarily or permanently are said to be magnetic. The important ones besides iron and ateel are other ferrous metals, such as nickel and cobalt and certain alloys. Magnetic force acts freely through all non-magnetic substances (5-83), but is screened by sheets of magnetic substances. Substances only weakly magnetic are said to be para-magnetic (5-83); substances which are anti-magnetic and which cause the lines of force to diverge are said to be diamagnetic (5-83).
- D. Lines and Fields of Magnetic Force. Magnetic flux seems to act along lines called lines of force (5-84), flowing out from the north pole and into the south pole. These lines can be demonstrated by placing a glass plate or a stiff paper over a magnet and dusting iron filings upon it (5 85). The filings arrange themselves along the lines. A magnetic field is the complete group or pattern of lines depicting magnetic conditions.
- E. Natural and Artificial Magnets. Pieces of magnetic iron ore, or of natural magnetic iron, called lodestones (2 474), were known to the ancients as having the power of attracting iron. Later, lodestones were used as compasses (2-474). A piece of ferrous metal stroked with one pole of a bar magnet is magnetised in turn, and acquires N. and S. polarity. Industrial permanent magnets are made to day by placing a piece of suitable metal in the field of an electro-magnet (see following Section, VI).

VI. ELECTRO-MAGNETIC INDUCTION.

The fact that electricity and magnetism are related phenomena was discovered when Oersted, established that an electric current had magnetic effects (3 210; 5-84), and Faraday (3-340) found that a magnetic field generated electric currents (3-142).

- A. Magnetic Field of a Current. When direct electric current passes through a wire, a magnetic field is created. In any plane cutting squarely across a straight wire, the lines of force are formed as concentric circles with the wire as a centre (5 85). If a wire carrying a current is bent into a loop, all the lines of force enter the loop at one face and come out at the other face. If several loops are put together, to form a coil, nearly all the lines of force will pass around the outside and through the centre of the coil, as if it were a single wire (5-85). If an iron core be placed within the loops of the coil, the power is greatly increased, and the device is called an electro-magnet (5-85). The strength of an electro-magnet depends upon the ampereturns, i.e. the strength of the applied current and the number of loops or turns of wire which form the coil.
- B. Induction of Current by a Magnetic Field.

 Faraday found that when lines of magnetic force move across a conductor, or when a conductor moves across lines of magnetic force, a current is set up or induced in the conductor. This discovery made it possible to turn mechanical

ELECTRICITY AND MAGNETISM -GEOGRAPHY

energy into electrical energy by the dynamo and alternator (3-142).

- C. Character of Induced Currents. Current is induced as described above only when the conductor is moving in the magnetic field; and the strength of the induced e.m.f. varies directly as the speed of the moving conductor. If the magnetic field moves and the conductor remains stationary, the effect is the same. Any induced current has such a direction that the magnetic action it sets up after it starts tends to resist or oppose the motion that produces it.
- D. Currents Induced by Other Currents. A change can be produced in the field of an electromagnet by altering the intensity of the current which flows through it and produces the field. Thus, if the coil of the magnet be supplied with direct current rapidly interrupted, a flow of current occurs rapidly varying in intensity at each "make" and "break" of the circuit (4-259), though not reversing in direction. A current rapidly turned on and off in this manner will set up an induced current in any conductor that lies across the lines of force. It is upon this principle that the induction coil (4-258) operates

GEOGRAPHY

If you could make from memory an accurate map of every country in the world, placing every mountain, every river, every gulf, every island, every boundary, every city and town in its exact and proper place, you might still know very little about Geography. You must learn to see a map as you see the outline of a picture which your imagination fills with bold scenery, flowing rivers, cloud capped mountains, fertile plains, great green

forests, wind-swept deserts, and, above all, people at work and play.

Geography, as treated in this Outline, is the study of the Earth as the home of Man. Thus, it deals with such things as the branches of mankind, their character, and their customs; the influence of climate upon crops and industries; the kinds of plants and animals that thrive in various regions; the ties of trade that bind nations and peoples together; the causes of wealth and poverty in different parts of the world—in fact, with the whole present structure of civilization. In so far as the past physical history of the world helps an understanding of the present, Geography encroaches on the special field of Geology. And in so far as the past customs of peoples have influenced their present manners, it encroaches on the field of History proper. A knowledge of Political Science, Economics, and every other branch of the "social sciences" is of prime importance to a complete understanding of Geography.

PHYSICAL GEOGRAPHY

The Earth as a Whole and Its Relation to the Sun

I. THE EARTH (8-149)

- A Its Form and Size.
 - a. Gravitation (4-65).
 - b. Magnetism (5-81).
- B. Motions of the Earth.
 - a. Rotation on its axis (8-149).
 - b. Revolution round the Sun (1-278).
- C. Results of Earth's Motions.
 - a. Rotation on axis causes day and night (3-55).
 - b. Revolution round Sun, coupled with mclined axis, causes changing seasons (6-526).

II. ZONES OF THE EARTH.

- A. The Tropical or Torrid Zone: the region of greatest heat—that portion of the earth where, at some time during the year, the sun is directly overhead at noon, so that the rays strike down perpendicularly (4-209: 8-294).
 - a. Extent. Since the earth's axis is 23\frac{1}{2} ** degrees from the perpendicular, the Tropical Zone occupies a belt of 23\frac{1}{2} degrees wide on each side of the Equator. This makes the whole tropical belt 47 degrees wide, which

amounts on the earth's surface to about 3,030 miles

- b. Boundary Lines. The limit of the Propies North of Equator 1- called the Tropic of Cancer; South of Equator the Tropic of Capricorn.
- B. Frigid Zones: regions of greatest cold—those portions of the earth surrounding the geographical Poles, where, at least once in every year, the sun does not rise above the horizon at noon, and where, at least once in every year, the sun does not sink below the horizon at midnight. At the Poles the sun remains continuously above the horizon for six months, and then remains below the horizon for six months.
 - a. Extent. 23½ degrees on each side of the two Poles, or 47 degrees in all. Because the earth is slightly flattened at the Poles (that is, is an oblate spheroid), 47 degrees there amount to nearly 3,300 miles.
 - b. Boundary Lines. The North Frigid Zone is bounded by the Arctic Circle; the South Frigid Zone by the Antarctic Circle.
- C. Temperate Zones: regions of inoderate heat and cold—those portions of the earth lying

between the Tropical Zone and the Frigid Zones, where the sun is never directly overhead and yet where it never fails to appear in the course of 24 hours.

Extent. Since there are 90 degrees between the Equator and each of the Poles, 231 of which are in the Tropical Zone and 231 in the Frigid Zone, it follows that each of the two Temperate Zones is 43 degrees in width, or about 2,960 miles. They are called respectively North Temperate Zone and South Temperate Zone.

The Story of the Earth's Materials

III. GEOLOGY (3-515); PHYSIOGRAPHY (6-136).

Note: Geology deals with the history of the earth's crust and of the materials that compose it. Physiography deals with the characteristic relief features of the earth's surface and with the causes that produced them.

IV. ATMOSPHERE OR AIR.

- Nature and Functions of the Atmosphere (5· 180).
- Atmosphere and Climate (4-209).
 - a. Temperature: the earth gets heat from the sun (4-146); temperature and weather maps -the meaning and usefulness of " isotherms" (2-410).
 - b. Moisture in the atmosphere: How moisture is measured with the hygrometer (4-225); How moisture gets into the atmosphere by evaporation (3-319); How the atmosphere releases moisture by condensation and preespitation: clouds (2-421); fog (3 405); dew (3 82); ramfall (6-360); snow (7-77); frost (8-477); How rainfull is measured (6-361).
 - c Pressure of the Atmosphere: Variation in air pressure (1-80); How air pressure is measured with the barometer (1-370).
 - d. Movements of the Atmosphere—wind (7-
 - e. Storms (7-169).
 - f. The British Meteorological Office and its work (7-433).

V. HYDROSPHERE OR WATER.

- A. Nature and Functions of the Waters of the Earth (7-424).
- Water Formations :
 - a. Ocean (5-494).
 - b. Lakes (4-438).
 - c. Rivers (3-515).
 - d. Springs (7-138).
- Oceans.
 - a. The Ocean Beds (5-498); size of oceans
 - (5-494): ocean depths (5-495).

- b. Movements of Ocean Waters: nature of waves (7-432); ocean currents (5 498); tides (7-274).
- c. Life in the Oceans (5 127); corals and their work (2-504); phosphorescence (6-161).

VI. LITHOSPHERE OR ROCK AND SOIL.

- Rock Formations of the Earth (3-515).
 - a. Igneous or Unstratified Rock--comprising all the rocks that have solidified from an intensely heated molten state: lava (4-456); granite (4-60); basalt -Fingal's Cave (7-140). Cliant's Causeway (4 87; 2 88); quartz (6 320); feldspar (3 345); obsidian (4 456); porphyry (4-456); pumice (6-305).
 - b. Sedimentary or Stratified Rock comprising those rocks produced by deposits of disintegrated matter from the older rock forms, by deposits of animal or plant remains, or by chemical precipitates.
 - 1. Rock Sediments: sandstone (6 320); clay (2 406); mudstone; shale (f.-i.).
 - 2. Annual and Plant Sediments: lunestone (4 509); dolomite (4 510); chalk (2 299); coal (2 426); peat (6 103); asphalt (1 274). 3. Chemical Sediments: gypsum (4 112);
 - salt (6 490).
 - c. Metamorphic Rock comprising ancient sedimentary forms that have undergone profound chemical and structural changes: marble (5 -120); flint (3 388); slate (7 65); inica (5 189).
- B. The Formation of Soil (7 83).
 - a. Residual Soils formed by the breaking down of the underlying rocks: sand (6 495); clay soils from shale (7-83); lunestone soils. b. Transported Soils - consisting chiefly of "alluvial" soils transported and deposited by rivers, "aeolian" soils transported by the wind, "drift" soils transported by glaciers, and "ash" soils composed of ashes from volcanoes: loam (7-83); loess $\{f.-i.\}$; drift Erosion by water (7-427); by wind.

Chief Features of the Earth's Surface and Their Origin

VII. PHYSIOGRAPHY OF THE EARTH (6-186).

- A. Continents (6-186).
- B. Mountains (6-187).
 - a. Origin of Mountains; "old "and "young" mountains.
 - b. Effect of Mountains on Climate (2-409); effect upon rainfall (6-360).
 - c. Effect of Mountains on Human Life (6-187).
 - d. Mountains the Chief Sources of Minerals.

- - a. Origin of Rivers (3.515); springs (7-138).
 - b. The Work of Rivers: cutting valleys and transporting soil; forming alluvial plains and deltas.
 - c. Effect of Rivers on Human Life: valuable for transport; irrigation; water power.
- D. Valleys (7-375; 6-187 188).
 - a. Origin of valleys.
 - b. "Old" and "young" valleys.

E. Lakes.

- a. Origin of Lakes (4-438).
- b. Influence on Human Life. Ancient lakedwellers (4-489); lake transport (Great Lukes, 4 68).
- c. Salt Lakes (Dead Sea, 3-55; Great Salt Lake, Utah, U.S.A., 7-371).

F. Plains and Plateaux.

- a. Origin of Plains and Plateaux (6-187).
- b. Influence on Human Life; concentration of population on plains.
- c. Various Kinds of Plains: tundras (1 264); stoppes (1-266); savannas (6 187); pampas (1-223); prairies.
- G. Deserts (3 78).
 - a. The Sahara as an example of the origin of deserts (6-484).

b. Other deserts: in Asia (1 266); in Australia; in South Africa (1 49), etc.

H. Islands.

Origin of some Islands: volcame action; the activity of the coral polyp (atolls) (6-28).

- I. Other Features of the Earth's Surface.
 - a. Volcanoes- their origin and behavious (7 404).
 - b. Earthquakes (3 152).
 - c. Goysors (4-15).
 - d. Caves (2 276).

VIII. MEASURING AND MAPPING THE EARTH.

- A. The Points of the Compass (2 474).
- B. Latitude and Longitude (4 452).
- C. Maps and Map-making (5-118).

DIVISIONS OF MANKIND

FOR the student of geography it is not so important to know the relationships and origins of peoples as it is to have a convenient method for grouping them according to their present-day customs, their degree of civilization, and their geographical distribution. The grouping followed in this Outline brings out some of the more generally accepted blood affinities, but in the main its purpose is to emphasise the geographical and cultural side of this great and important subject.

I. MAN'S PLACE IN NATURE (1-154; 3-323).

II. DIVISIONS OF MANKIND.

- A. The Many Methods of Classification (6 333).
 - a. Differences in hair.
 - b. Differences in language.
 - c. Geographical distribution.
- B. Divisions Based on Colour and Geographical Distribution.
 - a. The Caucasian, European, or white.
 - b. The Ethiopian, African, or black.
 - c. The Mongolian, Asiatic, or yellow.
 - d. The American, or red.
 - e. The Malay and Polynesian, or brown.

III. WHITE.

Note: Certain peoples, once important in history but now no longer existing as separate group have been included in this list; their names are printed in italic type.

A. South Mediterranean.

a. Hamitic - Types found chiefly in North Africa: Borbers (1-50); Ancient Acgeans (1-22); Etruscans or Tyrrhenians (8-305); Tuaregs: Copts; Kabyles, Masai, Gallas, Somalis.

Note: The people to-day called "Moors" are chiefly of Berber origin, but Arab and Negro blood is distinctly traceable among them. Historically the term Moor is often applied to the Mahomedan invaders of Spain.

b. Semitic—Types found chiefly in the Arabam Peninsula, Asia Minor, and North Africa: Arabs (1-190); Armenians; Assyrians (1-337); Carthaginians (2-255); Huttites (3-200), Israelites (Jews) (4-373); Syrians; Philistines (6-157); Phoenicians (6-160); Canaanites (4-374; 6-161).

B. North Mediterranean.

Note: The Europeans of to-day are the chief representatives of this great division, and therefore it is called the "North Mediterranean" branch of the white group. It includes, however, several Asiatic groups. The term "Aryan" (1-261), often used to describe those members of the white group who are believed to have originated in western Asia, is synonymous with "Indo-European" and can properly be used of living peoples only when they are being classified according to language.

- a. Primitive European Types: Basques (7-103); Iberians (Spain); Ligurians (Genoa) (f.-i.).
- b. Celts (2-288); Bretons (2-90); Britons (2-73); Gauls (6-430); Irish; Picts and Scots (2-75); Welsh.
- c. Latin Type: French; Italians; Portuguese;
 Rumanians (Rumans or Vlachs); Sabines
 (6-420); Spanish.
- d. Illyric Peoples: Albanians; Illyrians.
- e. Hellenic Peoples: Greeks: Macedonians (5-62).
- f. Lettic Peoples: Letts (4-453); Lithuanians.

g. Teutons: East Teurons - Danes (1-103; 3-276); Goths (4-48); Northmen or Normans (7-400; 3-314); Scandinavians; Vandals (7-379); Burgundians; West Teurons—Angles (2-75; 3-276; 5-199); Dutch; English; Franks (5-199, 202; 3-313, 449); Germans; Saxons (6-502; 5-199; 3-276); Alemannians (5-204); Lombards or Langobardi (5-19).

h. Slavs (7-66; 3-313; 5-204). Bulgarians (1-350); Croats (7-66); Czechs or Bohemians (7-66); Montenegrins (5-250); Poles; Russians; Serbs; Ruthenians or Ukrainians; Dalmatians, Moravians, Slovaks; Wends, etc.

i. Indo-Iranians: Armenians (1-242); Baluchis (1-358); Kurds (f.-i.); Medes (5-159);
 Persians: Hindus; Ceylonese or Sinhalese.

j. Caucasic Types: Circussians, Georgians.

IV. BLACK

A. Negrito Type.

a. Equatorial Pygmies (6-312; 5-396).

b. South African Branches: Bushmen (6 312); Hottentots (1-50).

c. East Indian Groups: Negritos of Philippines (6-156); Andaman Islanders (4-241); Semangs (5-94); Sakais (6-312).

d. Australian Groups. Blackfellows (1-314. 317 illus.); Tasmanians.

Note: The list of peoples named above presents unusual difficulties to the ethnologists. The student is specially cautioned against regarding this airangement as an implication of true blood affinity. They are grouped together because of their general resemblance to the Negro type, and because they present on the whole the lowest forms of civilization found in the world to-day.

B. True Negro Type:

- a. Sudanese Negroes.
- b. Guinea Coast Negroes : Ashantis.
- C. Negroid or Bantu Type (4-400; 1-51). Basutos (natives of Basutoland); Bechuanas (natives of Bechuanaland); Kaffirs (1-51. 7-90); Swahilis (f.-i.); Zulus (7-527).

V. YELLOW.

A. Eastern Mongolian Type.

- a. Southern Chinese.
- b. Indo-Chinese (4 256: 6-158): Annamese, Burmese; Siamese, Tonkinese; Shara, China, Kachana.
- c. Tibetan: Bhutanese; Nepalese; Tibetans.
- B. Western Mongolian Type. This type is sometimes called "Ural Altaic."
 - a. Manchu Group.
 - b. Mongol-Tartar Group: Kalmuks (5-239), Coseacks (2-514); Tartars (7-228); Huns (4-208); Kirghiz (f.-i.); Turkmens; Turks.
 - c. Finnish Group: Estonians or Ests; Finns; Lapps (4-446; 7-201); Magyars (5-86).
 - d. Japanese-Korean Group.

VI. BROWN.

A. Dravidian Group (4-241): Gonds, Bhils, Tamils (4-241); Veddahs (2-297).

B. Malayan Type.

- a. East-Indian Group; Dyaks (2-18); Javanese (4-355); Malays (5-93); Sumatrese; Igorots and Moros (6-156).
- b. Madagascar Group: Hovas and other Malagasies (5 65).

C. Oceanic Type.

- a. Papuan or Melanesian Group: New Guineans; New Hebrideans, New Caledonians, Solomon Islanders: Fijians (in part).
- b. Micronesian Group: Inhabitants of the Mariana, Pelew, Caroline, Marshall, and Gilbert Islands.
- c. Polynesian Group: Hawanans (4 139); Maoris (5-425); Samoans; Fijians (in part), Tahitians, Tongans, Marquesans (6 28), and other inhabitants of the more easterly Pacific islands.

Note: Some ethnologists believe the Polynosians to be descendants of an ancient Aryan or white stock that came eastward across south-eastern Asia and the waters of the Pacific centuries ago, settling in one after the other of the islands they now inhabit; others believe the Polynesians to be of Amer-Indian origin, descended from migrants crossing the Pacific westward from America.

VII. RED.

- A. Arctic Type: Eskimos (3-296) and Aleutian Islanders or Aleuts (1-90).
- B. North American Types (Alaska, Canada, and United States): Athabascan, Algonquian, Iroquoian, Muskhogean, Siouan, Shoshonean, and other groups (6–371).

Note: The so-called "Pueblo" Indians did not belong to any single tribe or group, but consisted of several independent stocks in various parts of the south-west who were distinguished by their settled and semi-civilized life in tribal villages.

C. Mexican and Central American Types.

- a. Nahuan Group : Aztecs (1-881);
 - b. Mayan Group: Mayas, in northern regions of Central America.
- D. South American Types. The chicaginage are: Chibean (Colombia); Quechuan (Peru; Incas, 4-237); Aymaran (southern Peru, Bolivia, and northern Chile); Calchaquan (northern Argentina); Araucaman (Chile and western Argentina, 2-359; 7-98); Cariban (Venezuela, Guiana, and Amazon delta); Tupi-Guarani (Brazil); Arawakan (formerly inhabiting Haiti, Puerto Rico, Cuba, the Bahamas, etc., as well as their present home in the Amazon Valley); Patagonian (southern Argentina, 6-96); Fuegian (Tierra del Fuego, and extending a short distance north of the Strait of Magellan).

CHOGRAPHY EUROPE

JUDGED by its size alone, Europe (3-308; map, 3-f.p. 308) is a minor division of the Earth's surface. Indeed, it is little more than a broken and irregular peninsula projecting westward from the vast land mass of Asia, and it is treated as a separate continent only because of its human and historical individuality. Yet, in the history of modern civilization and in the broadest geographical sense, Europe has played by far the most important part of all the continents. It has given its "point of view" to the world. Why has Europe prevailed over so much of the world? An adequate answer to that

Why has Europe prevailed over so much of the world? An adequate answer to that question would involve consideration of countless subtle forces and influences that it is perhaps impossible to analyse fully, but it is certain that Geography would play an important part in the answer to the problem.

1. POSITION AND AREA.

- A. The situation of Europe in the centre of the land masses of the globe gives it an enormous commercial and political advantage. This advantage of position will be made apparent by a glance at a map of the world.
- B. The area of Europe (about 4,000,000 square miles) is about one-fourteenth of the land area of the Earth. Its population of over 500,000,000 is approximately one-eighth of that of the Earth. The overcrowding of Europe forced its people to seek food supplies in other lands, and an outlet for its surplus population.

II. PHYSIOGRAPHY

A. Geological Influences:

- a. The Glaciers of the Ice Age (4 25; 1-125, 4-228).
- b. The Sinking of the Land. To this is due the exceedingly irregular outline of Europe, with its countless peninsulas and bays, its land-locked seas, and its numerous islands.
- B. Mountains and Highlands. The mountains of Europe are, as a whole, comparatively low and scattered, and nowhere do they cut off large interior areas from the moist sea winds.
 - a. Central and Southern Mountain Groups: Alps (1-120); Apennines (1-180); Dinaric Alps (3-300); Transylvanian Alps (6-469); Carpathian Mountains (2-245); Balkan. Mountains (1-349).
 - b. Central Highlands: Central massif of France (8-434); Jura Mountains (4-386) Vosges Mountains (7-406); Black Forest (1-478); Bavarian Highlands; Thuringian Hills and Harz Mountains (4-185); Bohemian Forest.
 - c. South-Western Mountains and Highlands: Pyrenees (6-313); Sierra Nevada $(f.\cdot i.)$ and other ranges and plateaux forming part of the Iberian Peninsula.
 - d. North-West Highlands: Brittany highlands; highlands of England and Wales, Scotland, Ireland; Kjolen Mountains of Scandinavía (5-462); mountains of Finland.

e. Mountains of the extreme East and South-East: Ural Mts. (7-369); Caucasus Mts.

C. Lowlands.

- a. Great Central Lowland: English plain; Paris Basin; Lowlands of Belgium and the Netherlands; North German Plain; plains of Denmark and S. Sweden; Great Plains of Russia.
- b. Smaller European Lowlands: Hungarian Plain; Lombardy Plain; Garonne Basin.

D. Seas and Chief Rivers flowing into them:

- a. Mediterranean (5-166). Chief divisions: Adriatic Sea (1-20); Aegean Sea; Tyrrhenian Sea. Rivers Rhône (6-395) and Po (6-231).
- b. Atlantic Ocean (1-292); Rivers of the Iberian Peninsula: Guadalquivir (7-6), Guadiana (6-297), Tagus (6-257), Douro. French rivers: Garonne (6-314), Loire (5-18).
- c. North Sea (5-460) and English Channel: Seine (6-530); Thames (7-261); Meuse (Maas) (5-185); Rhine (6-390); Elbe (8-207).
- d. Baltir Sea (1-857) Oder (f.-i.); Vistula (7-408).
- e. White Sea (f.-i.), with the Northern Dvina (3-308); and Arctic Ocean, with the Pechora river.
- f. Black Sea (1-480): Danube (8-47), Dnieper, Don, Dniester (6-472).
- g. Caspian Sea (2-256): Volga (7-405).
- E. Chief Islands forming part of Europe: Iceland (4-238); British Isles (2-85); Danish islands (8-72); Baleane Isles (1-349); Corsica (2-512).
 Sardinia (4-316; 3-314); Sicily (7-49); Crete (2-527); Malta (5-98); Aegean Is.

III. CLIMATE (8-308).

- A. Climate of Europe is chiefly oceanic.
 - a. Russia has continental climate.
 - b. Gulf Stream (4-105) warms Western Europe, as do also warm, rain-bringing west winds.
- B. Rainfall (6-360).

The British Isles

CUT off from the rest of Europe by the English Channel and the North Sea, the British Isles (2 85) have suffered no actual invasion from the Continent since the Norman Conquest in 1066. No part of these islands is far from the sea, on which their inhabitants have always been at home. Until, thanks to internal quiet, natural mineral resources, and the native inventiveness of the people, the "industrial revolution" began in Britain in the late 18th century, long before it started elsewhere, the population was small, and the islands produced all necessities for their mhabitants. With industrial development, the population increased; there was no longer enough home-grown food for all. British traders and sailors carried British manufactures to every corner of the globe, bringing back with them food, and raw materials for more manufactures, from distant lands still dependent on agriculture. The British Isles became the most prosperous of all countries. Two world wars and world-wide development of industry greatly reduced Britain's relative prosperity; but many advantages of the islands' geographical position remained. For maps, see 3-f.p. 248 (England), 4 282 (Ireland), 6 511 (Scotland), and 7 412 (Wales).

PHYSIOGRAPHY.

- A. Irregular Coastline produced by the rising and sinking of land.
- B. General characteristics.
 - a. Description of English country (3-247).
 - b. Wales, a country of hills and low mountains (7-410).
 - c. Scotland (6 510) and its highlands.
 - d. Ireland, an inland plain surrounded by low mountains (4-281).
- C. Soil. Fertile in England; good in Scottish lowlands, poor in highlands; thin in Ireland.
- D. Lesser Islands: Hebrides (4-152); Shotland Islands (7-27); Isle of Man (5-110); Isle of Wight (7-449); Orkney Islands (6-4); Channel Islands (2-302); Seilly Isles (6-509).

II. CLIMATE AND NATURAL RESOURCES.

- A. Climate tempered by Westerlies and Gulf Stream drift.
- B. Fairly heavy rainfall.
- C. Natural Resources.
 - a. Many good harbours.
 - b. Coal, iron, tin, copper, zinc, and lead.
 - c. Fishing ground in the North Sea.

III. CHIEF INDUSTRIES.

A. Manufacturing: Textiles—cotton; woollen, linen; silk; rayon; nylon. Porcelain and pottery; iron and steel products; shipbuilding; motor vehicles; aircraft; electrical equipment.

- B. Engineering in all its branches.
- C. Mining.
- D. Fishing.
- E. Agriculture, including stock raising and darrying

IV. COMMERCE AND TRANSPORT.

- A. International, Commonwealth, and Colonial Trade.
- B. Transport
 - a. Shipping.
 - b. Rivers and Canals.
 - c. Roads.
 - d. Railways.
 - e. Aviation.

V. IMPORTANT CITIES

- A. In England: London (5-19); Bruningham (1-473); Liverpool (4-524); Manchester (5-111); Sheffield (7-23); Leeds (4-475);
- Bristol (2 71); Newcastle-upon-Tyne (5 394),
 Plymouth (6 229); Southampton (7 101),
 Dover (3-109), etc.
- B. In Scotland : Glasgow (4-28); Edinburgh (3 162); Aberdeen (1 4). Stirling (7-158);
 Lanark (4 444); etc.
- C. In Ireland : Dublin (3 129) : Belfast (1 416) ; Cork (2 505) : etc.
- D. In Wales: ('archif (2 220); Swansea (7 200); Aberystwyth (2 220); otc.

The British Commonwealth of Nations

(Flags: see col. plates 3-384, 385. For map, see 2 83)

1. SELF-GOVERNING MEMBERS.

Australia (1 312); Canada (2-195); Ceylon (2 297); New Zealand (5-422); Pakistan (6 39); Union of South Africa (7-88).

II. ASSOCIATED INDEPENDENT STATES.

- A. Republic of India (4 239): an independent republic within the Commonwealth, recognizing the British Sovereign as its First Citizen.
- B. Republic of Ireland (4-284): an independent republic outside the Commonwealth, but not recognized as a foreign country.

III. COLONIES, PROTECTORATES, AND DEPENDENCIES.

- A. In Europe: Gibraltar (4 20); Malta (5 98).
- B. In Africa:
 - a. British Somaliland (7 84).
 - b. British East Africa (2 84): this includes Kenya Colony and Protectorate, Uganda Protectorate, Tanganyika Territory, Zanzibar Protectorate and Pemba.
 - c. Central Africa. Federation of Rhodesia (6-394) and Nyasaland (6-395).

- d. South Africa. South-west Africa (Protectorate of the Union of South Africa) (7-89); Bechuanaland; Swaziland, Basutoland (7-88, 89).
- e. West Africa (7 440): Nigeria, Gold Coast, Sierra Leone, Gambia, Cameroons, Togoland. f. Islands. Mauritus (5 149); St. Helena and Ascension Island; Tristan da Cunha (f.-i.).

Note: The Angle Egyptian, Sudan became the Republic of the Sudan in 1956 (7 179).

- C. In Asia: Cyprus (3–20); Aden (1–18); Bahrem Islands (1–191); Seychelles Islands (f.-7.); Singapore Colony (7–57; 5–94); Federation of Malaya (5–93); Hong Kong (4–191).
- D. In North and South America: Bermudas (1 434); Bahamas (1 347), Barbados (1 366); British Honduras (2 292); Jamaica (4 337);

other West Indian Islands (7 442); Trimidad (7 317) and Tobago (f.-i.), British Ginana (4 102), Falkland Islands (3 339).

E. Islands of the Pacific: British North Borneo (including Brunei and Sarawak) (2-18), Australian New Guinea (Papua and N.E. New Guinea) (5-395); Fip Islands (3-351), New Hebridos (ruled jointly with France), New Britain and New Ireland, British Sumon, British Solomon Islands, Gilbert and Ellice Islands, Tokelau Islands, Tonga (or Friendly) Islands, Pitcairn Island, Cook Islands (6-26-32)

Note: After the First World War former German territories in New Guinea, New Britain, and the Solomons were inaudated to Australia, German Sainoa to New Zealand. These territories and former German colomes in Africa, mandated to the U.K., were placed under U.N. trusteeship in 1946.

France

STRETCHING from the North Sea to the Mediterranean, and bordered by the Atlantic Ocean on the west. France (3 431, map, 3 432) has broad open gateways to all avenues of world commerce. Its position gives it a variety of climate, ranging from warm to temperate, so that the soil produces, with the aid of the abundant rams, a wide range of crops. Able to satisfy with home products virtually all their frugal requirements, the First house had in the past little incentive to strive for foreign commerce, and small hking for colonisation. Their martial qualities, however, made France a world power, still of great standing despite loss of strength in the two World Wars.

I. PHYSIOGRAPHY (3 132).

- A Mountains and Highlands:
 - a. Chief Ranges: Mps (1 120). Pyrenees (6 313); Jura Mts (4 386). Vosges Mts (7 406).
 - b. Lesser Ranges and Highlands: Ardennes Hills (1 222), Auvergne Mts., Cevennes chain; highlands of Brittany and Normandy
- B. Plains, including Paris Basin (3 433).
- C. Chief Rivers: Seme (6 530). Lone (5 18); Garonne (6 314), Rhone (6 395).
- D. Island of Corsica (2 512).

II. CLIMATE.

The winds from the Atlantic bring abundant moisture, keep the temperature mild

III. NATURAL RESOURCES.

- A. Fertile soil.
- B. Minerals: coal, iron, and building stone.
- C. Forest lands.
- D. Rivers form valuable links.

IV. CHIEF INDUSTRIES AND PRODUCTS.

- A. Agriculture is the most important industry.
 - a. Principal crops: Wheat, oats, rye, barloy, potatoes, sugar-beet.
 - b. France leads in grape growing.
 - c. Livestock: cattle, horses, sheep, goats, pigs, poultry.
- B. Fisheries: cod, oystors, sardines.
- C. Mining and Quarrying.
- D. Manufacturing : textiles and leather, wine, gloves, perfumes, soap, porcelain, iron and steel products, sugar.

E. Transport:

- a. Rivers and Canals.
- b. Roads.
- c. Railways
- d. Airways.

V. CHIEF CITIES.

Paris (capital) (6 79), Marseilles (5 136); Lyons (5 55); Bordeaux (2 16), Lille (4 506); Nantes (5 316); Teolouse (f. a.), St. Etienne (3 434), Nice (5 430); Havre (4 138); Cherbourg (3 438); Rouen (6 456); Rheims (6 379), Amiens (1 139); Brest (2 55); Calais (2 166); Orleans (6 5); Metz (5 185); Versailles (7 394), Dunkirk (3 136).

VI. OVERSEAS COUNTRIES OF THE FRENCH UNION.

- A. Algeria (1 108). This country of North Africa forms part of metropolitan France, and is represented in the National Assembly and the Council of the Republic in Paris
- B. Overseas Departments. Martinique (5 138); Guadeloupe (4 100), Reumon Island; French Guana (4 102).
- C. Overseas Territories.
 - a. French West Africa (6 485): Senegal. French Gumea, Ivory Coast, Dahomey. French Sudan, the Niger, Mauritania.
 - b. French Equatorial Africa (2–482): Gabun, Middle Congo, Ubangi Chari, Chad.
 - c. Madagascar and its dependencies (5 64).
 - d. French Somaliland (7 84).
 - e. New Caledonia and its dependencies.

- f. French Oceania.
- g. Saint-Pierre and Miquelon, N. America.
- D. Trusteeship Territories.

 Part of Togoland and the Cameroons.
- E. Anglo-French Condominium.
 The New Hebrides, Pacific Ocean.

Note: Certain territories within the French Union until the mid-1950s have since achieved full independence. These are the former protectorates of Morocco (5-264) and Tunisia (7-324), in North Africa; and the states of Vietnam (7-399), Cambodia (2-179), and Laos (4-445), in Indo-China (4-256).

Belgium ·

BELGIUM (1-417: map. 1-418) is primarily a manufacturing country, most of the population being crowded into industrial centres. But the countryside is covered with small farms that are made to yield large crops by intensive and careful cultivation.

I. PHYSIOGRAPHY.

- A. General character of the country: sand-dunes along the sea, hills (Ardennes) in the south-east, fertile plains in between.
- B. Chief Rivers: Scheldt (f.-i.) or Escaut; Meuse (5-185).

II. CLIMATE.

Like that of northern France and southern England, with mild winters, cool summers, and an abundance of rain.

III. NATURAL RESOURCES,

- A. Chief minerals: coal, iron, sand for making glass.
- B. Good farm land.

IV. CHIEF INDUSTRIES.

- A. Agriculture: principal crops are wheat, rye. flax, sugar-beet.
- B. Mining.
- C. Manufacturing: chief products are iron and steel, artificial silk, motor-cars, glass, lace, linen, wool, gloves, sugar.
- D. River and canal navigation.
- E. Fisheries.

V. CHIEF CITIES.

Brussels (capital) (2-99); Antwerp (1-178). Liége (4-498); Ghent (4-16); Bruges (2-97); Ostend (1-417); Louvain (5-45).

VI. BELGIAN COLONIAL TERRITORY.

Belgian Congo (2-481).

Grand Duchy of Luxemburg

THIS small, independent, mountainous territory (5-54), of about 1,000 square miles, lies between France, Belgium, and Germany. It is highly cultivated and has important iron deposits; it makes pig iron and steel.

Switzerland

SWITZERLAND (7-211; map, 7-214) is a land of high mountains and deep valleys. The mountains attract many visitors in winter and in summer; the valleys are carefully cultivated. Switzerland is also famous for its watches and clocks.

I. PHYSIOGRAPHY.

- A. Mountains: Alps (1-120): Jura Mts. (4 386).
- B. Narrow Plateau between the two ranges.
- C. Rivers rising in Switzerland : Rhine, Rhone, Asr. Ticino, Inn.
- D. Other Physical Features: Many lakes; majestic glaciers.

II. CLIMATE.

Much cooler than that of the surrounding lowlands. There are heavy rains in summer and great snow-falls in winter.

II. NATURAL RESOURCES.

The chief resources are the scenery, the pasture land, and the plentiful supply of water-power.

IV. CHIEF INDUSTRIES.

- A. Catering for Tourists.
- B. Dairying and agriculture: goats and cattle supply the very important dairying industry; crops are wheat, rye, cats, potatoes.
- C. Manufacturing: chief products are watches and clocks, precision instruments, cheese and condensed milk, chocolate, salt.

V. CHIEF CITIES.

Berne (capital) (1-485); Zürich (7-528); Geneva (3-511); Basle (1-880).

The Netherlands

THE NETHERLANDS (5-870) is primarily a commercial country, whose prosperity rests upon thrift, bold scamanship, and the Dutch merchant's world-wide reputation for rigid honesty. Dutch navigators of the 15th and 16th centuries were among the most adventurous in the world, sailing East and West in search of new lands and markets, and founding colonies, part of which in the East developed into the republic of Indonesia.

I. PHYSIOGRAPHY.

A. Alluvial soil brought by three rivers.

B. Nearly half the land is below sea level. How the sea is kept out (5-372) and land reclaimed (5-377).

C. Land is not naturally fertile.

D. Rivers: Rhine (6-390); Maas (or Meuse) (5-185); Scheldt (f.-i.).

II. CLIMATE.

Damp and cool; severe cold in winter.

III. NATURAL RESOURCES.

A favourable situation for ocean commerce, a considerable area of pasture land, some coal and deposits of pottery clay.

IV. CHIFF INDUSTRIES.

A. Dairying and dairy products.

B. Agriculture: chief crops are rye, oats, potatoes, sugar-beet, wheat, flax, tulip-raising.

- C. Manufacturing: textiles, ropes, dyes, chemicals, sugar refineries, aircraft factories, etc.; diamond-cutting; pottery making.
- D. Shipbuilding.

V. COMMERCE AND TRANSPORT.

- A. Large amount of shipping.
- B. Canals, rivers, railways.

VI. CHIEF CITIES.

Amsterdam (1 141): Rotterdam (6-455); The Hague (seat of government) (4-116); Utrecht (7 372); Geoningen (5-370).

NETHERLANDS WEST INDIES.

Surinam (Dutch Guiana) (4-101); Netherlands Antilles (Curação, etc.) (5-370).

NETHERLANDS NEW GUINEA.

Germany

NEITHER soil nor climate, nor the temper of its people, has inclined Germany (4-1; maps, 4-2, 6) to remain an agricultural nation. After the unification of the German states in 1871, Germany rapidly developed into a powerful manufacturing and commercial country, and because its workers were content with a lower standard of high than those of Britain, it became a serious trade rival of Britain in all the markets of the world. Defeat in two World Wars left Germany with little immediate outlet for a population heavy in proportion to its resources.

I. PHYSIOGRAPHY.

A. Highlands in the South:

a. Bavarian highlands; Black Forest (1-478).
b. Thuringian Hills and Harz Mountains (4-185).

c. Erzgebirge or "ore mountains" of Saxony (6-503).

B. Northern Germany is part of great European

C. Chief Rivers: Rhine (6.390). Ems (f.-i.);
 Weser (4-1); Elbe (3-207); Oder (f.-i.);
 Danube (8-47).

II. CLIMATE.

Drier and marked by greater extremes of temperature than the lands to the west. The winds from the Atlantic have lost much of their moisture by the time they reach central Germany.

III. NATURAL RESOURCES.

A. Minerals: coal, iron, potash, building stone, petroleum.

- B. Forests.
- C. Water-power, from the many rivers of the mountains.

IV. INDUSTRIES.

- A. Manufacturing: nron and steel products, motor-cars, textiles, chemicals and dyes, pottery and porcelan; beer, wine, jewelry, toys; wood products.
- B. Agriculture: principal crops are wheat, rye, barley, oats, sugar-beet, hops, potatoes, flax, fobacco, grapes.
- C. Livestock.
- D. Shipbuilding and fisheries.

V. TRANSPORT.

- A. Railways, rivers, and canals.
- B. Roads.

VI. HISTORIC DIVISIONS OF GERMANY.

Prussia; Bavaria; Württemberg; Baden; Saxony; Thuringia; Hesse; Hamburg; Lübeck; Bremen.

VII. DIVISIONS AFTER THE SECOND WORLD .WAR.

In 1945 the northern half of E. Prussia was incorporated in Russia (R.S.F.S.R.); rest of Germany east of the Oder was placed under the administration of Poland. The remainder of Germany was divided into the following zones of occupation:

- a. British (N.W.): Schleswig-Holstem, N. Rhine Westphalia, Hamburg, Lower Saxony.
- b. French (W.): Rhineland Palatinate, Baden, Wurttemberg-Hohenzollern, Snar.
- c. U.S. (S.W.): Bavaria, Wurttemberg-Baden, Bremen, Hesse.

d. Russian (E.): Brandenburg, Saxony, Saxony-Anhalt, Mecklenburg.

In May 1949 the British, U.S., and French zones (except the Saar area, which in 1948 had been made an autonomous state) were formed into the (W.) German Federal Republic with Bonn as capital. In October 1949 the Russian zone was proclaimed the (E.) German Republic, capital (E.) Berlin.

VIII. CHIEF CITIES.

Berlin (1 432); Bonn (1 520); Hamburg (4 121); Munich (5 295); Leipzig (4 476); Dresden (3 126); Cologne (2 456); Frankfort-on-Main (3 459); Hanover (4 128).

Austria

PART of the Dual Monarchy of Austria-Hungary before the First World War, Austria (1 322) was, after its defeat, reduced to a small republic in which more than one-fifth of the population lived in the capital. Vienna. Annexed by Germany in 1938, Austria became a separate country 1945, Allied-occupied until the peace treaty in 1955.

I. PHYSIOGRAPHY.

- A. Mountains: Alps in the western, central, and southern regions.
- B. Lowlands: the valley of the Danube lies between the highlands; and there is a small strip of the Hungarian plain in the east.
- C. Rivers, etc.: the Inn (4 263) is the most important tributary of Austria's chief river, the Danube (3 47); there are many fine lakes.

II. CLIMATE.

Austria has a varied inland continental climate, with heavy rainfall and snows in the mountains.

III. NATURAL RESOURCES.

In the lowlands and toothills, farmland and pasture; timber in the highlands (35 per cent. of total area is forested); deposits of iron, copper, zmc, lead, coal and lignite, magnesite, graphite, petroleum; hydro-cloctric power.

IV. INDUSTRIES.

- A. Agriculture: principal crops are wheat, rye, barley, oats, potatoes, and turnips. Grapes for wine. Horses, cattle, and sheep.
- B. Manufactures: textiles, pianos, iron and steel goods, perfirmes and fashion goods.

V. CHIEF CITIES.

Vienna (capital) (7 397); Graz (f, \cdot, \cdot) ; Salzburg (f, \cdot, \cdot) ; Innsbruck (4 263).

VI. MAIN DIVISIONS.

Provinces of Upper Austria (divided between U.S. and Russian zones of occupation); Lower Austria (Russian zone); Burgenland (Russian zone); Salzburg (U.S. zone), Tirol and Vorarlberg (French zone); Carmthia, East Tirol, Styria (British zone); Vienna (divided into five sectors).

Denmark

DENMARK (3 72: map, 3-72) consists of the peninsula of Jutland and several islands lying at the entrance of the Baltic Sea. Although their land borders on Germany, the Danes are more closely connected by blood, customs, and traditions with Sweden and Norway. Denmark's prosperity is due to the thrift and industry of its people.

I. PHYSIOGRAPHY.

- A. Peninsula of Jutland: stormy barren west coast and protected smiling east coast.
- B. Islands large part of total area: Fyen. Zeoland, Laaland, Falster, Moen, Bornholm.
- C. Character of the surface : low plams, wood-lands, swamps.
- D. Coastline faces North Sea and Baltic.

II. CLIMATE.

Denmark is exposed to cold and damp winds, which bring an abundance of moisture.

III. NATURAL RESOURCES

Farmland, pasture land, pottery clay, and fishing waters are the only natural sources of wealth; forestry is carried on scientifically.

IV. INDUSTRIES.

- A. Agriculture is the chief industry.
 - a. Chief crops: oats, rye, barley, potatoes, sugar-beet, hay.
 - b. Importance of dairying.
 - c. Effective work of co-operative societies.

- B. Fisheries: Cod, salmon, shrimp, lobster, haddock, herring, flounder.
- C. Manufacture of porcelain.

V. CHIEF CITIES.

Coponhagen (capital) (2 500), Aarhus and Aalborg (3 72); Odense (3 741 illus.)

VI. POSSESSIONS OF DENMARK.

A. Faroe Islands (8-75). These islands, lying

about midway between Scotland and Iceland, enjoy local autonomy, they send representatives to the Damsh parliament. Chief industries—fishing and sheep raising.

B. Greenland (4-94). This, the largest island in the world, is a province of Denmark, until 1953 it was a colony. Population mostly Eskimos. Chief industries: fishing, seal hunting, trapping, eryolite mining.

lecland

ONCE belonging to Denmark, the North Atlantic island of Iceland (4 233), map. 4 234) became an independent republic in 1944. Reykjavik (4 233), the capital, is the only town of any size.

I PHYSIOGRAPHY.

- A. Mountainous Plateau: volcance rocks, with glaciers and snowfields, compuse most of the island. Chief volcano is Hekla.
- B Lowlands amounting to only one fifteenth of total area, in S and S.W. Unproductive and sandy
- C Coasts: rugged high cliffs, with deep fjords affording harboure

II. CLIMATE.

Iceland has an Arche climate, cold and stormy,

but modified by provading S.W winds and warm Atlantic drift

III. NATURAL RESOURCES

Fish in great quantities, hot water geysers, many swift mountain streams providing water power, small deposits of lignite and sulphin, Iceland spar

IV. INDUSTRIES.

- A. Fisheries. Cod the chief fish, salmon and trout in inland waters
- B. Agriculture: roating of ponics, sheep, and cattle, dairying.

Sweden and Norway

THE Scandinavian Pennisula (map. 5-463), occupied by Sweden and Norway, is attached to the rest of Europe by a computatively narrow neck in the extreme north, boundary here between Scandinavia and U.S.S.R. is formed partly by the Munno and Fina rives. Norway has on the whole a warmer, moister climate than Sweden, with ice free ports. The Baltic Sea harbours of Sweden are ice locked throughout the winter. This makes the Norwegian people a more important scattaining ration than the Swedish but excessive rains, combined with poor soil, keep the agricultural development of Norway far behind that of Sweden.

I. SWEDEN (7 200).

A Physiography.

- a. Separated from Norway by Kjolen Mts.
- b. Divided into three natural regions—Gota land, a fertile region in the extreme south, Svealand, a middle region of lakes and hills, Norrland, a northern region of vast forest-covered mountains, includes part of Lapland.
- c. Coastline irregular, rocky in places, sandy in others; part of southern coast faces the Kattegat branch of the North Sea.
- B Climate. Summers in Sweden are short, winters are long. The extremes of temperature are greater than in Norway. The mountains also cut off much of the moisture carried by winds from the North Sea.
- C. Natural Resources.
 - a. Fertile soil in the south.

- b. Fish plentiful in Beltic and inland waters.
- c. Forests and inneral deposits
- d Navigable rivers and water power.

D. Industries.

- a. Agriculture is the most important industry. Chief crops are oats, rye, barley, potatoes, and sugar beet.
- b. Lumbering and mining (iron, copper, silver, load, zinc, sulphur pyrites).
- c. Fisheries.
- d. Manufacturing. chief products are matches, furniture, wood pulp, paper, porcelain, glass, textiles, iron and steel products, sugar.
- e. Transport: railways, tivers, canals, and sea shipping.
- E. Chief Cities: Stockholm (capital) (7-158); Goteborg, Malmo, Norrkoping, Helsingborg.

II. NORWAY (5-462).

A. Physiography.

- a. Separated from Sweden by the Kjolen Mts.
- b. Nearly all Norway covered with rugged mountains and plateaux.
- c. Coastline broken by countless fjords and bordered with small islands.
- d. The North Sea and the Skagerrak.
- e. Spitsbergen Islands (Svalbard) (7-187).
- B. Climate. The temperate ocean winds and the effect of the Gulf Stream (4-105) help to make the climate of Norway milder than that of Sweden and the lands farther east. The winters, however, are long and the summers short. The northern third of Norway lies inside the Arctic Circle.

C. Natural Resources.

- a. Great forests of pine and fir.
- b. Fish plentiful in coastal waters.

- c. Some minerals (fron, copper, zinc, lead, silver); immense coal deposits on Spitsbergen Islands.
- Agricultural land confined to small valleys.
- e. Water-power; countless natural harbours.

D. Industries.

- Fisheries: cod, herring, mackerel, salmon; whaling.
- b. Lumbering and lumber products.
- c. Agriculture: oats, rye, barley, potatoes.
- d. Stock raising and dairying; reindeer are raised in the extreme north.
- e. Manufacturing: chemicals, machinery, woodenware.
- f. Transport. Norway is one of the important shipping countries of the world.
- E. Chief Towns. Oslo (capital) (6-7); Bergen; Trondhjem; Stavanger; Narvik; Hammerfest.

Finland

FROM the 13th to the 18th century a possession of Sweden, and from 1809 to 1917 a grand duchy of tsarist Russia, Finland (3-353) is one of the new countries created after the First World War. During the Second, Finland fought and was defeated by the Soviet Union, losing some territory in the peace settlements of 1940 and 1947.

I. PHYSIOGRAPHY.

- A. Plateau, rising in the north, covers most of the country; surface is marshy and pitted with thousands of lakes.
- B. Coastline: indented, low, and island-fringed, with narrow coastal plain.

II. CLIMATE.

Long, cold winters; short, hot summers.

III. RESOURCES and PRODUCTS.

A. Forests: over half the land area; timber, wood-pulp and paper; shipbuilding.

B. Grazing land: cattle, sheep, goats, pigs, horses, reindeer, chief crops are oats, barley, rye, potatoes.

C. Fisheries: herring, seal, salmon, trout

D. Water-power, from many short rivers.

IV. CHIEF TOWNS.

Helsinki (capital) (4-160); Turku; Oulu; Tampere

Poland

THE name Poland (6-238; maps, 6-238, 239) has stood for very different areas at different periods of history. From 1795 no country of the name appeared on the map until Poland was recreated in 1918-21 from parts of Germany, Austria, and Russia. Reoccupied by Germany and Russia in 1939, Poland re-emerged as a separate country, but with different boundaries, in 1945.

I. PHYSIOGRAPHY.

- A. Part of great central lowland of Europe.
- B. Much of the land is marshy and dotted with lakes
- C. Carpathian Mountains on southern boundary.
- D. Vistula river and its tributaries drain most of Poland.
- E. Coastline on the Baltic Sea.

II. CLIMATE.

Winters are long; springs are rainy; summers are dry and often extremely hot.

III. RESOURCES AND PRODUCTS.

- A. Agriculture: rye, oats, wheat, baftey, sugar beet, potatoes, hemp, and hops.
- B. Minerals and mining: coal, iron zinc, tin, copper, sulphur.
- C. Manufacturing: textiles, leather and leather goods, lumber and wood products, metal products, beef-sugar.

IV. CHIEF CITIES.

Warsaw (capital) (7-419); Lodz (6-(6-238); Danzig (Gdansk) (8-48).

Czechoslovakia, Hungary, and Rumania

THESE three countries are sometimes called the Central European States. The first two came into separate existence as a result of the First World War, having formerly been parts of Austria-Hungary; the third gained its independence by the treaty of Berlin, 1878. All three countries lie, in whole or in part, in the great Danube Basin.

I. CZECHOSLOVAKIA.

Czechoslovakia (8-21; map, 3-22) is made up of the former Austrian provinces of Bohemia (1-503). Moravia, and Slovakia. These historic provinces were abolished 1949, and the country was divided into 19 regions, each named after its chief town.

A. Physiography.

- a. Mountains and highlands: Moravian Hills, Bohemian Forest (Bohmer Wald), Ore Mountains (Erzgebirge), Giant Mountains (Riesengebirge), Carpathian Mountains.
- b. Rivers: Head waters of Elbe; Danube on southern boundary, and tributaries of Danube.
- B. Climate. Abundant rainfall; cold winters and hot summers.
- C. Resources and Products.
 - a. Timber and timber products.
 - b. Agriculture: wheat, rye, barley, oats, potatoes, beets, hops.
 - c. Minerals and mining: coal, iron, graphite, silver, copper, lead, salt.
 - d. Manufacturing Textiles, glass, furniture, machinery, paper, chemicals, beet-sugar, beer.
- D. Capital and chief city: Prague (6 279).

II. HUNGARY (4 205).

A. Physiography.

- a. Slopes of Carpathians form northern boundary.
- b. Great Hungarian Plain (Alföld) covers remainder of Hungary and extends eastward into Rumania and southward into Yugoslavia.
- c. Chief Rivers: Danube flowing across central. Hungary, Theiss (or Tisza) in the east, Drava on the southern boundary (map, 4 205).
- B. Climate. Hungarian Plain has less moisture than surrounding highlands, but rainfall is most abundant in the late spring, which favours the early growth of crops, while the late summer is hot and dry, which helps the crops to ripen; the winters are extremely cold.
- C. Resources and Products.
 - a. Agriculture: the Hungarian Plain is the richest agricultural region in Europe. Chief

crops: wheat, rye, barley, oats, corn, sugarbeet, hops, grapes, tobacco, flax.

b. Stock and horse raising; Dairying.

- c. Minerals and mining: coal, iron, and bauxite.
- D. Chief City: Budapest (capital) (2 105).

III. RUMANIA (6-469).

A. Physiography.

- a. Mountains: southern spurs of Carpathian Mountains including Transylvanian Alps.
- b. Uplands of Transylvania wost of mountains.
- c. Strip of Hungarian plain on western border.
 d. Lowland plain in east and south comprising
- lower Danube basin and stretching to Black Sea. This is the south-western tip of the Russian plain, which forms a part of the Great Central Lowland of Europe.
- e. Rivers: Danubo and its tributaries the Prut (boundary with U.S.S.R.) and Seret.
- B. Climate. Mountains and western slopes have typical Central European climate; castern plains suffer from extremes of heat and cold.
- C. Resources and Products.
 - a. Agriculture: wheat, rye, barley, oats, maize, beans, potatoes, sugar-beet, tobacco, grapes and other fruit.
 - b. Timber and timber products.
 - c. Minerals and mining: coal, salt, silver, iron, lead, copper, and marble.
 - d. Important petroleum fields.
- D. Chief Cities: Bucharest (capital) (2-102)

 Jassy, Constanta.

LIECHTENSTEIN.

This principality (4 491) of 62 square miles lying between Austria and Switzerland, and formerly dependent upon Austria-Hungary, was given its independence in 1918. Chief products of the principality are: grain, wine, fruit, timber, livestock, cotton goods, leather, and pottery.

Spain and Portugal

THE Iberian Pennsula (map, 7 104), which is occupied by Spain and Portugal, is cut off from France and the rest of Europe by the formidable wall of the Pyreneos. The coastline has few natural harbours large enough to accommodate modern ships, and most of the rivers are rushing mountain streams unfit for navigation. The interior is a high rough plateau, criss-crossed by lofty ridges that interfere with transport from one part of the peninsula to the other, and with climate and soil unfavourable to agriculture. Portugal, with a long seaboard on the Atlantic, has a more favourable climate and a more productive soil than has Spain.

I. SPAIN (7-108).

A. Physiography.

a. Mountains: Pyrenees (6-313); Cantabrian Mountains; Sierra Nevada (f.-i.); Sierra Morena.

b. Central Tableland or Plateau.

c. Valleys and Lowlands. Valley of the Ebro; a narrow strip on the Gulf of Valencia; the valley of the Guadalquivir broadening out on the Gulf of Cadiz.

- d. Guadalquivir and Ebro are the only navigable streams.
- e. Smooth Coastline with few natural harbours. f. Balearic (1-349) and Canary (2-207) Islands.
- B. Climate. The rainfall on the Atlantic coast is extremely heavy; it is lighter on the Mediterranean coast; and in many parts of the mountain-crossed interior semi-desert conditions prevail. Extremes of heat and cold exist in the interior, but on the coast the climate is much milder.

C. Resources and Products.

- a. Agriculture: wheat, barley, oats, rye, maize, beans, peas, sugar-beet, grapes, clives, oranges, lemons, flax, hemp. Irrigation is important.
- b. Stock Raising: sheep, goats, pigs, poultry, cattle, horses, mules, asses.
- c. Minerals and mining: coal, iron, lead, copper, mercury, zinc, sulphur, potash, salt.
- d. Fisheries: sardines, tunny.
- e. Manufacturing: cotton goods, woollens, wine, leather, paper, glass, cork, lumber.
- f. Large but little developed sources of water-power.
- D. Chief Cities: Madrid (capital) (5 70); Barcelona (1-367); Valencia (7-373); Seville (7-5).
- E. Spanish Possessions: Rio do Oro and Spanish Guines, on West Coast of Africa.

II. PORTUGAL (6-267).

- A. Physiography. Portugal has mountains inland, small lowland areas on the coast. Its principal rivers, the Douro and the Tagus, are navigable. Azores (1-330); Madeira (Funchal) (5-65).
- B. Climate. Being more exposed to the tempering winds of the Atlantic, Portugal has on the whole a milder and moister climate than Spain.

C. Resources and Products.

- a. Agriculture: wheat, maize, outs, rye, barley, grapes, olives, figs, tomatoes, oranges, onions, muts, potatoes.
- b. Stock Raising: sheep, goats, cattle, pigs.
 c. Forests: cork and other forest products are among the chief sources of wealth.
- d. Minerals: coal, copper, manganeso, lead, tin, kaolin, sulphur, gold.
- e. Fisheries: sardines, tunny, cod.
- f. Manufacturing: wine, cork and cork products, resin and turpentine, olive oil.
- D. Chief Cities: Lisbon (capital) (4 521); Oporto.

E. Overseas Provinces.

- a. Atlantic: Capo Verde Islands (2-218); St. Thomas and Principe.
- b. Africa: Portugueso Guinea; Augola: Mozambiquo.
- c. Asia: Portuguese India (Goa, Daman, Diu); Macao, part of Timor Island.

ANDORRA (1 149).

This tiny semi-independent republic hes in the Pyrenees between Spain and France. Area 191 square index; population about 5,000.

Italy

ITALY (4 304; map, 4 305), with its commanding position in the Mediterranean Sea, dominated the world in the days when the Mediterranean was the centre of civilization in Europe. Its beauty, its history, and its art treasures still give it great importance.

I. PHYSIOGRAPHY.

A. Mountains.

- a. Alps along the northern boundary (1 120).
- b. Apennines form backbone of peninsula (1 180).
 - 1. Highlands of Sicily are part of same land formation as the Apennines.
 - 2. Volcanoes: Vesuvius (7 395); Etna (8 303).
- B. Lowlands. These include the plains of Lombardy and the valley of the Po, the plains of Tuscany, the Roman Campagna, and coastal plains along the Tyrrhenian and Adriatic Sens.
- C. Chief Rivers: Po (6-231); Tiber (7 272); Adige (4 304); Arno (4 304).
- D. Principal Lakes: Maggiore and Como (4 304).
- E. Islands: Sicily (7-49); Sardina (6 499).

II. CLIMATE.

The Alps shelter the northern plain, but at times a cold wind (the Tranontana) blows down from their snow-covered heights. The summers are not throughout the peninsula; except in the higher mountain regions the winters become increasingly mild towards the south. Rainfall, in the winter, is usually plentiful.

III. NATURAL RESOURCES.

- A. Good Soil and Forests.
- B. Minerals. With the exception of marble, the mainland of Italy contains little numeral wealth. Sardinia provides iron, zinc. and lead; Sicily yields sulphur.
- C. Water-power.

IV. INDUSTRIES.

- A. Agriculture: wheat, maize, potatoes, sugar beet, grapes, olives, oats, beans, rice, barley, ryo, lemons, oranges, tomatoes.
- B. Stock Raising: sheep, cuttle, goats, pigs, horses, mules, asses.
- C. Mining and Quarrying: sulphur, marble, iron. zinc, lead, mercury, manganese.
- D. Fisheries: tunny, sardines, cordl.
- E. Manufacturing: silk, cotton, and artificial silk goods; wines, olive oil, hemp, hats, rubber, leather; motor-cars, iron and steel products, pottery, glass, paper, chemicals, augar, macaron, soap.

V. CHIEF CITIES.

Naples (5-317); Milan (5-204); Rome (capital) (6 427); Turin (7 331); Palermo (7 49); Genoa

(3-512); Florence (3-392); Bologna (1-510); Venice (7-387); Ravenna (6-367); Pisa (6-207).

TERRITORY UNDER U.N. TRUSTEESHIP. Somalia, or Italian Somaliland (7-84).

SAN MARINO (6-497).

This is a small independent republic, area 38 square miles, completely surrounded by Italian territory.

Yugoslavia, Bulgaria, Albania, Greece

OCCUPYING the Balkan Peninsula (1-349) and adjacent territory, these four countries are called the Belkan States. Their history has been one of strife and confusion, much of which can be explained in geographical terms. Their position in relation to the Near East and Russia has involved them in intense political intrigues.

I. YUGOSLAVIA.

This state, recognized in 1919 as the kingdom of the Serbs, Croats, and Slovenes, took the name Yugoslavia (7 517; map, 7-518) in 1931. It consists of Serbia (6-532); Montenegro (5-250); Bosnia and Herzegovina (2-20), and other landspreviously belonging to Austria-Hungary. The northern boundary extends into the Hungarian Plam.

A. Physiography.

- a. Mountains. All of Yugoslavia, except the northern strip of the Hungarian Plain, is covered with rugged forested highlands and mountains, including the Dinaric Alps.
- b. Lowlands. The valleys of the Sava and the Drava and part of the Danube valley.
- B. Climate. The climate, particularly on the southern mountain slopes, is mild. Extremes of cold are found only in the highest interior ranges. Rainfall is plentiful along the coast and in the foothills to the north, but scunty in some of the enclosed tablelands.
- C. Resources and Products:
 - a. Agriculture: wheat, barley, oats, maize, potatoes, rye, sugar-beet, hops, tobacco, fruit (particularly grapes and plums), hay.
 - b. Stock Raising: sheep, goats, cattle.
 - c. Minerals and mining: coal, iron, bauxito, copper, lead, zinc, antimony, manganese, mercury, salt.
 - d. Manufacturing: flour, beer, wines, sugar, wood products.
- D. Chief Cities: Bolgrade (capital) (1-422);
 Zagreb (Agram) (7-518); Split (Spalato) (3-28).

II. BULGARIA.

- A. Physiography. The Balkan Mountains he across the middle of Bulgaria (2 119) from west to east. To the north is a lowland plain extending to the boundary, which is part of the Danube valley. South of the Balkan Mountains are highlands surrounding a strip of plain which extends to the Black Sea (1-480).
- B. Climate. Generally mild with cold winters in the mountains of the interior.
- C. Resources and Products:
 - a. Agriculture: wheat, maize, ryo, tobacco, grapes and other fruit, sugar-beet, roses.
 - b. Stock Raising: sheep, cattle, goats.
 - c. Minerals and mining: coal, iron, bauxite, salt.
- d. Manufacturing: tobacco, wine, perfumes.

 D. Chief Cities: Sofia (capital) (7-82); Ploydiv.

III. ALBANIA.

- A. Physiography. Rugged mountains lie behind the narrow strip of coastal plain on the Adriatic that forms Albania (1 91).
- B. Climate. Extremely mild, except in the highest mountain regions, where the winters are severe.
- C. Resources and Products:
 - a. Agriculture: wheat, maize, tobacco, olives.
 - b. Stock Raising: sheep, goats, cattle.
 - c. Minerals: coul, copper, chromite, salt
 - d. Manufacturing: olive oil, flour, cement
- D. Chief Cities: Tirana (capital); Shkoder (Scutarr) · Durres (Durazzo).

IV. GREECE

A. Physiography.

- a. Mountains and Plains. All of Greece (4 71, map, 4-72) is criss-crossed by ranges of low mountains and hills, with small valleys and plains between. The Pindus Range extending down from the north-west border, is the most important of the mountain systems.
- b. Coastline. Marked by countless gulfs and peninsulas, among which the most important are the Gulf of Corinth and the Peloponnese, or Morea.
 - c. Surrounding Islands: Crote (2 527). Sporades and Cyclades; Ionian Islands (4-78); Dodecanese (1-25).
- B. Climate. Temperate, with moist winters and dry summers.

C. Resources and Products:

- a. Agriculture: wheat, maize, barloy, grapes, currants, ohves, oats, tobacco, cotton, oranges, lemons, rice, figs, nuts.
- b. Stock Raising and Dairy Products: sheep, cuttle, cheeso.
- c. Minerals and mining: iron, lead, magnesite, chromite.
- d. Manufacturing: olive oil, wines, textiles.
 e. Sponge Fishing.
- D. Chief Cities: Athens (capital) (1 287); Salonika (Thessaloniki) (4 79; 7-483); Piracus (port of Athens) (1-287).

TURKEY IN EUROPE. Of its former possessions in Europe, Turkey retains control only of Istanbul (4-303) and Edirno (Adrianople), with Chatalia and Eastern Thrace, totalling about 9,000 square miles.

Russia-in-Europe

RUSSIA (6-472; map, 6-476), last of the European states to come under the influences of western civilization, belongs as much to Asia as it does to Europe. This Outline deals only with European Russia, that is, the part of the Union of Soviet Socialist Republics west of the Ural Mountains; for Asiatic Russia, see page 102 in this volume.

I. PHYSIOGRAPHY.

- A. Most of Russia is a great lowland plain.
 - a. The fertile "Black Belt."
 - b. Steppes and barren tundras.
- B. Mountains:
 - a. Low Ural Mountains on the east.
 - b. Rugged Caucasus Mountains m south.
- C. Rivers, Lakes, and Inland Seas.
 - a. Volga, largest river in Europe (7-405).
 - b. Lake Ladoga, largest lake in Europe (f.-i.).
 - c. Black Sen (1 480); Cuspian Sea (2 256).

II. CLIMATE.

rtussia has a wide variation in temperature between winter and summer, dry winds, and uncertain rainfall. The Russian plains extend from the frozen Arctic Zone to the temperate regions of the south.

III. RESOURCES AND PRODUCTS.

- A. Agriculture and Stock Raising.
 - a. Great areas of extremely fertile soil.
 - b. Chief Crops: wheat, rye, oats, barley, corton, potatoes, flax, hemp, sugar-beet, tobacco, rice.
 - c. Livestock: sheep, cattle, horses, pigs, goats.
- B. Forests and Timber Products. Lumber, wood-pulp, tar, turpentine, resin.
- C. Fish and Fisheries. Chief products of fisheries are salmon and sturgeon, the latter yielding caviare and isinglass.
- D. Minerals and mining. Coal, platnum, petroleum, iron, manganese, cobalt, sulphur, moreury, copper, zinc, gold, silver, iridium, lead, asphalt, peat, precious stones.
- E. Manufactures. Iron and steel products, machinery, coment, textiles, furs, hides, chemicals, paper, sugar, shows.

IV. TRANSPORT.

- A. River and Canal Transport.
- B. Railways. There are some 30,000 miles of railway in operation in European Russia.

V. MAIN DIVISIONS.

- A. The western part of the R.S.F.S.R. (Russian Soviet Federal Socialist Republic).
 - a. Products: in the north, reindeer, furs, fish, timber; in the centre, cereals, cattle; in the south, wine, tobacco, cotton. Coal, oil, iron, copper, precious metals and stones, salt, etc., are found throughout the Republic, especially in the Uruls.
 - b. Chief Cities: Moscow (capital) (5-268); Leningrad (4-479); Gorky (6-472); Rostov (6-472, 7-491, 493); Stalingrad (7-142).

- B. Ukraine (6-479), in the south-west, was devastated during the Second World War.
 - a. Products: coal and iron (Donetz basin), chemican in the south; sugar-beet in the central steppes: cereals and cattle.
 - central steppes; cereals and cattle.

 b. Chief Cities: Kiev (capital) (4-408);
 Kharkov (f.-i.); Odessa (5 499); Dniepropetrovsk (f.-i.); Stalino; Lvov (f.-i.).
- C. White Russia (Byelorussia), in the west (6-479).
 - a. Products: flax, potatoes, hemp; cattle, pigs, timber, dairy and engineering products. b. Chief Cities: Minsk (capital) (f.-i.); Vitebsk (f.-i.); Gomel.
- D. Moldavia, in the south-west (6 478).
 a. Products: wheat, maize, barley, sunflower seed; fruit, including grapes; sturgeon, mackerel, brill; wine, perfumes.
 - b. Capital: Kishinev.
- E. Estonia (8-298; 6-477).
 - a. Products: rye, oats, barley; butter timber products, including matches and furniture.
 - b. Capital: Tallinn (or Reval).
- F., Latvia (4-453; 6-478).
 - a. Products: flax, oats, barley, potatoes;
 timber products, chemicals, textiles; amber
 b. Capital: Riga (6-402).
- G. Lithuania (4 523; 6 478).
 - a. Products: rye, oats, wheat, barley, flax. darry products; timber and wooden goods. agricultural machinery.
 - b. Chief Cities: Vilnius or Vilna (capital).
 Kaunas (Kovno).
- H. Karelian A.S.S.R., in the north-west (6-477), bordering Finland (see also 8 367).
 - a. Products: timber, wood-pulp, paper.b. Capital: Petrozavodsk.
- I. Azerbaijan, in Caucasia (6-477).
 - a. Products: grain, cotton, wine, tea, tobacco, silk; cattle; petroleum, copper, bauxite, sulphur, salt.
 - b. Capital: Baku (1-848).
- J. Georgia, in Caucasia (8-524; 6-477).
 a. Products: tea, citrus fruits, bamboo, tobacco, grapes, silk, wine; magganese, coal, baryta, marble.
 - b. Chief towns: Tbilisi or Tillis (capital). Batum,
- K. Armenia, in Caucasia (1-243; v-477).
 - a. Products: wine, tobacco, grain, sugar-beet. cotton, almonds, figs and other fruits; cattle. marble, molybdenum, fertilisers, cement. pumice stone; carpets, textiles.
 - b. Capital: Erivan (1-242).

AFRICA

A FRICA (1-49; maps, 1-52, f.p. 53), second in size of the continents (after Asia), is the most backward. The Nile valley once developed a great civilization (that of ancient Egypt), and is still highly cultivated; but the greater part of Africa lies within the Tropics, and is subject to stifling heat and debilitating discuses. Some Negro tribes in the interior still live the life of primitive savages, though the number of those who have had no contact with the white man is rapidly diminishing. The presence in this continent of about 40 million white men, and nearly five times as many slowly awakening black men, has posed social and moral problems that have still to be solved.

I. POSITION AND AREA.

Africa extends an equal distance north and south of the Equator. With its area of 11,699,000 square miles, it is about three times as large as Europe and contains one-fifth of the globe's land surface.

II. PHYSIOGRAPHY.

- A. The great mass of Africa consists of a High Tableland surrounded by narrow Coastal Plains.
- B. Former land connexion with Europe.
- C. Mountains and Highlands. Most of the higher mountain ranges are on or near the sea coast.
 - a. Atlas Mountains in the north-west (1-109). b. Highlands of the East. These include the cableland of Nubia, the Abyssinian Mountains, and the East African Runges. The last, mostly o volcanic origin, contain Kilmanjaro, the lughest peak on the continent, the "Great Bift Valley," and Ruwenzon.
 - c. South African Highlands.
- D. Lowlands. Congo lowland; narrow coastal low bands.
- E. Forests, Grasslands, and Deserts:
 - a. Great forests of Central Africa.
 - b. Savanna region of the Sudan north of the great forests.
 - c. Veld region to the south.
 - d. Sahara Desert (6 484), the largest and waste in the world. The Libyan Desert, the Nubian Desert, and the Arabian Desert are eastern continuations of the Sahara.
 - e. Kalahari Desert in South Africa.
- F. Chief Rivers and Lakes:
 - a. Nile, the only large African river flowing into the Mediterranean (5 439).
 - b. Congo and its vast busin (2 480).
 - c. Niger (5 434); Zambezi (7 521) and Victoria Falls (7 397).
 - d. Lake Chad; Victoria Nyanza (7 397); Lake Tanganyika (7-221); Albert Nyanza; Albert Edward Nyanza; Lake Nyasa (4 527).
- G. Coastline is unbroken—few natural harbours. Coasts on Mediterranean Sea (5-166); Red Sea (6–875); Indian Ocean (4-255); Atlantic Ocean (1-292); Cape of Good Hope.

H. Islands off the Coast of Africa:

a. Madagascar, the only large island (5 64). b. Small islands in the Atlantic: Madena Islands (5 65); Canary Islands (2 207). Cape Verde Islands (2 218). Ascension (f.i.). c. Small islands in the Indian Ocean: Zanzibar and Pemba (7 521); Mauritius (5 149), Comoro Islands, Réumon, the Seychelles.

III. CLIMATE.

- A. Hot Equatorial Climate modified in places by altītude.
- B. Climate of the Mediterranean Coast.
- C. Desert Climate.
- D. Bracing Climate of South Africa.
- E. Rainfall. Heavy in tropical forest areas; moderate in south ; absent in Sahara.

IV. MINERAL RESOURCES OF AFRICA.

- A. In North Africa: petroleum, copper, antimony, iron, lead, zinc, sulphur, manganese, phosphates, morcury.
- B. In East Africa: coal, iron, lead, copper.
- C. In South Africa: gold, diamonds, copper, coal, iron, tin, lead, silver, uranium.
- D. In West Africa: coal, tm, lead, gold, silver, uranium, diamonds, bauxite.

V. VEGETABLE AND ANIMAL LIFE.

- A. Typical Vegetation of Africa: monkey-broad tree or baobab (f.-i.), mangrove (5 118); chony (3-156); cypress (3 20); lotus (5 40). papyrus plant (6 71); elephant grass, date palm (6 59 illus.); oil palm (6 50); bamboo (1 359); groundnut (4 98); banana (1 859).
- B. Typical Animals of Africa: aardvark (1 2); leopard (4 484); hon (4 520); clephant (8 225); hippopotamus (4 179); rhinoceros (6-392); monkey (5 240); baboon (5 241) and mandrill (5 242); chimpanzee (2 360); gorilla (4 48); buffalo (2-109); camel (2 183); girafic (4 21); wild ass (1-275); zebra (7 522); eland and other antelopes (1-170); wart hog (7 420); crocodile (2 532); cobra (2-486); horned viper (6 29b); outrich (6-8); gumea fowl (4-104); teste fly (7-323); termites (7-259).

Divisions of Africa

I. NORTHERN AFRICA.

- A. Egypt (8-172; map, 8-174), an independent sovereign state.
 - a. Chief Products: cotton, wheat, barley, maize, millet, rice, sugar, clover, petroleum, cotton and silk goods, morocco leather, pottery.
- b. Chief Cities: Cawo (capital) (2-163); Alexandria (1-101); Port Said; Assiut (f.-i.); Suez (3-176); Damietta (f.-i.).

 B. Republic of the Sudan (7-179); former Anglo-Assiut
- Egyptian Sudan.
 - a. Chief Products: guin arabic, ivory, cotton, ostrich feathers, palm nuts, dates, sesame, hides, skins.

- b. Chief Towns: Khartum (4-402); Omdurman.
- C. Libya (4-488), independent kingdom (from 1952; Italian 1912-1942).
 - a. Chief Products: dates, olives, lomons, figs, grapes, cereals, saffron, almonds, bananas, barley, cattle, sponges.
 - b. Chief Towns: Tripoli and Bonghazi (joint capitals).
- D. Tunisia (7-324; map, 1-109): former French protectorate, independent since 1956.
 - a. Chief Products: olives, wheat, barley, onts, grapes, dates, almonds, oranges, lemons, pistachios, alfa-grass, henna, cork; sheep, goats, cattle; sardines, tunny, sponges; lead, zinc, iron, phosphate.
 - b. Chief Towns: Tunis; Sfax; Susa; Kuirwan.
- E. Algeria (1 108; mup, 1 109): part of Metropolitan Franco.
 - a. Chief Products: wheat, barley, outs, maize, potatoes, artichokes, beans, peas, tomatoes, flax, tobacco, wine, fruits, olive oil, cork; sheep, goats, cattle; sardines, anchovies, tunny; iron, lead, zinc, coal, knolin.
 - b. Chief Cities: Algiors (1 109); Oran; Constantine.
- F. Morocco (5 264; map, 1-109): independent since 1956; formerly part French, part Spanish.
 - a. Chief Products: barley, wheat, beans, linseed, olives, dates, almonds, figs; sardines, tunny; sheep, goats, cattle, horses; phosphate, iron, anthracite, manganese.
 - b. Chief Cities: Marrakesh (5 265 illus.); Fez (f.-i.; 5 265 illus.); Taugier (7 222).
- G. Rio de Oro and Ifni (Spanish).
 - a. Products: This colony is virtually desert land, without important products.
 - b. Capital: Villa Cisneros.

II. EAST AFRICA.

A. Abyssinia (or Ethiopia) (1 5), independent kingdom.

Resources and Products: hides, skins, coffee, wax, ivory, eivet, burley, millet, wheat, tobacco; iron, gold, coal, silver, sulphur; timber. Capital: Addis Ababa.

B. Somaliland (7-84).

a. Somalia (administered by Italy under U.N. trustoeship). Chief industries: cattle raising, agriculture. Chief town: Mogadishu.
b. British Somaliland. Chief products: skins, hides, gum, resin, cattle, sheep. Chief town: Hargeisa.

c. French Somaliland. Chief products: coffee, ivory, hides, skins, salt. Chief town: Jibuti.

C. British East Africa (2-84).

a. Kenya Colony and Protectorate. Products: cotton, wheat, maize, coffee, sisul-hemp, pyrethrum, tea, wattle bark; butter, hides

- and skins. Chief towns: Nairobi (capital): Mombasa.
- b. Uganda (protectorate). Products: cotton, coffee, oil-seeds, sugar, tobacco, ivory. Capital: Entebbe.
- c. Tanganyika Territory (held under U.N. trusteeship). Products: coffee, cotton, oil-seeds, sisal-hemp; hides and skins, beeswax; timber. Capital: Dur-es-Salaam.

d. Islands of Zanzibar and Pemba (7-521). Products: cloves, econuts (copra), hides, pottery, coir-fibre, coconut oil, rope, soap, oil cake, jewelry, mats. Chief city: Zanzibar.

D. Mozambique (Portuguese East Africa) (6–268).
a. Chief Products: sugar, coconuts, beeswax, ivory, gold, coal, uranium.

b. Chief Towns: Mozambique; Lourenço Marques; Beira.

III. WEST AFRICA.

Products typical of West Africa (7 440) are ebony and other hard woods, ivory, groundnuts, manioc, yams, gum, palm-oil and kernels, dyewoods, bides, skins, and feathers.

- A. French West Africa and the Sahara (6 485) Capital: Dakar.
 - a. Senegal. Capital, St. Louis.
 - b. French Guinea. Chief town: Konakry.
 - c. Ivory Coast. Chief towns: Abidjan (capital); Grand Bassam.
 - d. Dahomey. Chief town: Porto Novo.
 - e. French Sudan (7-179). Chief towns: Bainako (capital); Timbuktu.
 - f. Mauritania and Niger Territory: desert land, except for south Niger.
 - g. Togoland, or Togo (under U.N. trustee-ship). Chief towns: Lome; Anecho.
 - h. Cameroons (under U.N. trusteeship). Chief town: Yaoundé.
- B. British West Africa (2 81).
 - a. Nigeria (colony and protee orate: a selfgoverning federation). Capital: Lagos.
 - b. Cameroons (under U.N. trusteeship; administered within Nigeria). Chief town: Victoria.
 - c. Gambia. Capital: Bathurst.
 - d. Sierra Leone (colony and protectorate). Chief town: Freetown.
 - e. Gold Coast (includes part of former German Togoland under U.N.; since 1954 has all-African parliament). Capital: Accra.
- C. Spanish West Africa: Spanish Guinea (Rio Muni) and Fernando Po.
- D. Portuguese Guinea (6-268). Capital: Bissau
- E. Liberia (4 485), an independent Negro republic under United States protection. Capital: Monrovia.

IV. MIDDLE AFRICA.

A. French Equatorial Africa (2-482).

a. Products: palm-oil, ivory, coffee, cotton. copal; livestock; copper, zinc, lead, dia monds; timber.

b. Chief Towns: Port Gentil; Libreville.

B. Belgian Congo (2-481).

a. Products: rubber, palm kernels, palmoil, coffee, cotton, uranium, gold, diamonds, copper, iron, tin, radium, cobalt.

b. Chief Town: Leopoldville (capital).

C. Angola (Portuguese) (7 141)

a. Products: coffee, wax, cocoa, tobacco, diamonds, salt, palm-oil and palm kernels, cotton, sisal.

b. Chief Towns: Suo Paulo de Loanda (capital), Bengucia.

V. CENTRAL AFRICAN FEDERATION (British).

A. Nyasaland (British protectorate) (6 395;
 1 55). Products cotton, tobacco, coffee, teachingstock. Seat of government. Zomba.

B Rhodesia (6 394)

a. Products: eattle, sheep, goats, dairy-products, hides and skins; gold, silver, copper, zinc, lead, coal, diamonds, maize, cotton, wheat, fruits; timber.

b. Chief Towns: Salisbury (capital of colony of Southern Rhodesia) (6 489). Bulawayo (6 395). Layingstone (capital of protectorate of Northern Rhodesia).

VI. SOUTH AFRICA (British).

- A. Basutoland (1) (7 89). Products wheat, maze, sorghum, sheep. Chief town Maseru
- B Bechuanaland (protectorate) (1.51, 7.89) Products cattle, sheep, goats, hides. Chief town Scrowe
- C. Swaziland (protectorate) (7-89) Products: asbestos, gold, cattle, tobacco, maize, sorghum, groundants Capital Mbabane
- D. South-West Africa (7-89), administered by the Union of S Africa.

a. Products: cattle, sheep, goats; karakul pelts (lambskins), diamonds, copper, tin. b. Capital: Windhoek,

E. Union of South Africa (7-88), map, 7-90), This includes the provinces of Cape of Good Hope (2-215), Natal (5-325) & Transvaal (7-308), Orange Free State (5-524)

a. Chief Products:

1 Agricultural: wheat, barley, oats, maize, potatoes, tobacco, tea, sugar, cotton, fruit 2 Livestock: sheep, goats, cattle, pigs, horses, mules, asses, ostriches, butter, cheese, wool, mohair, hides, skins, ostrich teathers 3. Minerals: gold, uramum, diamonds.

coal, copper, tin, asbestos, manganes.

4. Manufactures: leather, chemicals, wine, furniture, vehicles, textiles, tinned foods.

b. Chief Towns: Cape Town (legislative capital of the Union, and capital of Cape Province) (2 217); Kimberley, Port Elizabeth, Pieter maintzburg (capital of Natal). Pretoria (administrative capital of the Union, and capital of Transvaal) (6 285), Johannesburg (4 377), Bloemfontem (capital of Orange Free State)

VII. MADAGASCAR (French) (5 64)

A. Products .

a. Agricultural: rice, sugar, coffee, manioc, beans, maize, potatoes

b. Minerals: graphite, mica, precious stones, coundum.

c. Manufacturing: silk, cotton goods, straw hats, metal and food products

B. Chief Towns: Antanamarivo (capital), Tunnatave.

ASIA

ASIA (1 264, maps, 1 268, fp 269), the giant of the comments, contains Mt Everest, the highest peak in the world, and the Dead Sea basin, the lowest valley more than 1,000 feet below ocean level. It has the most extensive tablelands and the greatest area of lowland plains; the bleakest and most barren desert and the most fertile and densely populated farm lands, regions of the severest cold and of the greatest heat. Asia is the home of more than half the human race, and out of Asia have come so many great contributions to human development that it is often called "the Mother of Civilization."

I. POSITION AND AREA.

The northern tip of Siberia has nearly 600 miles inside the Arctic Circle, while the southern tip of the Malay Peninsula almost touches the Equator. Connected by land in the west to Europe and divided from Africa only by the man-made Sucy Canal, the continent reaches in the extreme northeast to within 50 miles of America. One third of the land surface of the globe is included in Asia.

II. PHYSIOGRAPHY.

A. Mountains and Interior Plateaux.

a. Plateau of Asia Minor or Anatolia, and Taurus Mountains.

b. Elburz Mountains and Hindu Kush, marking northern boundary of the Iranian Plateau. c. Great Pamir, meeting-place of Hindu Kush, Karakoram, and Tian Shan Ranges.

- d. Himalaya Mountains, forming a vast wall between the central highlands and the plains of India Mount Everest, the highest mountain in the world (3 319).
- e. Plateau of Tibet between Himalayas and Kwenhin Mountains.
- f. Plateau of Eastern or Chinese Turkestan between Tian Shan and Kwenlun Mountains.
- g. Gobi Desert and Plateau of Mongolia between Altai, Yublonoi, and Khingan Mountains

B. Detached Ranges: .

a. Ural Mountains, on boundary of Europe.

b. Volcame ranges on Pacific side extending through Kamchatka, Sakhalin, the Kurilo Islands, the islands of Japan, the Korean pennsula, and Formosa.

C. Lowland Plains and worn-down Tablelands:

a. Arabian plateau and plains of Iraq.

- b. Plains of India and the Deccan.
- c. Highlands and plains of Indo-China and Siam.
- d. Lowlands of Eastern China and Manchuria. e. Great Siberian plains and Siberian high-
- lands. f. Lowlands of Wostern or Russian Turkestan.
- D. Chief Rivers and Lakes.
 - a. Rivers flowing into the Arctic Ocean: Ob, Yenisei, Lona.
 - b. Into the Pacific: Amur, Hwang, Yangtze.
 - c. Into the Bay of Bengal and Indian Ocean: Brahmaputris, Ganges, Irawadi.
 - d. Into the Arabian Sea and Persian Gulf: Indus; Tigris and Euphrates.
 - e. Lakes and Inland Seas: Caspian Sea (2-256); Sea of Aral (1-201) with its two rivers, Syr-Daria and Amu-Daria; Lake Balkhash (f.-i.) and Lake Baikal (f.-i.).

III. CLIMATE.

- A. Great variety of Asiatic climate.
- B. High mountain ranges and interior plateaux suffer from extremes of heat and cold and from lack of well-distributed rain. The great "Desert Belt" stretching over from Africa.
- C. Siberia has dry steppes, frozen tundras, and rain-soaked eastern coast.
- D. Tropical climate with heavy rains in the south and south-east.
- E. Tremendous importance of monsoon winds to south in Asia.

IV. MINERAL RESOURCES.

Almost every known mineral is found in Asia; development (especially in Asiatic Russia) is beginning.

V. VEGETATION AND ANIMAL LIFE.

- A. Typical Plants of Asia.
 - a. Siberia. Falls into three zones: (1) the Arctic tundras, where little grows except moss and lichens; (2) the forest lands, where there is enough rain and warmth to

- support pine, fir, larch, birch, willow, poplar; and (3) the dry steppes, where grasses are the prevailing vegetation.
- b. Central Highlands and Deserts. Except in rare sheltered valleys, desert cases, or the southern slopes of a few ranges, little vegetation or animal life is found here.
- c. Temperate slopes of the Himalayas. The southern slopes of the great mountain barrier support a dense vegetation of trees and undergrowth. Typical forms are the rhododendron, magnolia, deodar, bamboo, cane.
- d. Plains of India. Typical forms here are the babul, mango, banyan, plantain, betel palm.
- e. Tropical South. Typical forms are teak, sandalwood, satinwood, ironwood, ebony, rosewood, bamboo, orchids, catechu plant, innumerable spice plants.
- f. Eastern Coast. Coastal plans of China are so densely inhabited and so closely cultivated that there is virtually no wild vegetation.

B. Typical Animals of Asia.

- a. Northern Zone: reindeer (6 379); polar bear and brown bear (1 390); seal (6 525); wolf (7-404); fox (3 426); badger (1 345). ermine (3-295); mink (5-221), otter (6 10), grey squirrel (7-140); hare (4 134); sable (f.-i.; 3-496).
- b. Central and Southern Zone: monkey (5 240); elephant (3 225); rhinoceros (6 392). tiger (7-276); hon (4 520); leopard (4 484). Himalayan bear and sun bear (1-390), hyena (4-222); jackal (4 333); wild dog. wild ass (1-275); camel (2 183); yak (7-511); buffalo (2-109); ibex (4-227) und other wild goats; many species of wild sheep (7-20); antelopes (1-170); deer (3-59); wild boar (1-496); mongoose (5 239); squirrel (7-140); bats (1-380); hornbill (4 195). pheasant (6-153); peacock (6-100); weaverbird (f.-i.); crocodile (2-532); cobra (2 436); python (6-315); adjutant (1-20).

Asiatic Russia

THE Asiatic portion of the U.S.S.R. (6-472; map, 6-476) comprises the eastern half of the R.S.F.S.R. from the Urals to Vladivostok on the Pacific Ocean, and five Soviet Republics. Every type of climate and product is found, and development of mineral resources was speeded up during and after the Second World War when so much of European Russia was devastated by battle.

I. PHYSIOGRAPHY.

- A. Siberian Plains—divided into Arctic tundras, central timber lands, and southern steppes.
- B. Plains and Deserts of Western Turkestan.
- C. Mountains and Highlands:
 - a. Ural Mountains on the boundary between European and Asiatic Russia.
 - b. Eastern highlands; Stanovoi Mountains, c. Tian Shan, Pamir, Altai on souther
 - c. Tian Shan, Pamir, Altai on southern border.
- D. Rivers: Ob, Yenisei, Lens, Amur.

E. Lakes and Inland Seas: Caspian Sea (2-256); Sea of Aral (1-201); Lake Baikal; Lake Balkhash.

II. RESOURCES AND PRODUCTS.

- A. Agriculture: wheat, rye, oats, barley, vegetables, cotton, silk, tobacco, rice, etc.
- B. Stock Raising and Dairying: cattle, sheep, camels; eggs, butter.
- C. Fishing: cod, herring, fresh-water fish.
- D. Timber and timber products.

- E. Minerals and Mining : coal, iron, petroleum, copper, lead, silver, gold, platinum, nickel, graphite, tungsten, tin, zinc, salt, mica, precious stones, radio-active ores, etc.
- F. Fur Industry: seal, fox, ermine, mink, sablemarten, otter, grey squirrel.
- G. Manufacturing: rugs, textiles. leather, machinery, paper, chemicals, tobacco.

III. ASIATIC R.S.F.S.R.

This part of the R.S.F.S.R. is divided into four territories (Altai, which includes the Gorno-Altai autonomous region, Krasnoyarsk, Khabarovsk, and Primorye), 11 regions (Sverdlovsk, Tiumen. ('helyabınsk, Kurgan, Omsk, Novosibirsk, Tomsk, Kemerovo, Irkutsk, Chita, and Sakhalin), three autonomous regions (Khakas, Gorno-Altai, mentioned above, and Tuva), and two autonomous soviet socialist republics (Buriat-Mongol and Yakutsk).

- a. Products: as for Asiatic Russia generally, except that it has no sub-tropical products.
- b. Chief Towns: Sverdlovsk; Trumen, Chelyabınsk ; Kurgan ; Omsk ; Novosıbırsk ; Tonisk ; Komerovo ; Irkutsk ; Chita.

IV. REPUBLICS IN CENTRAL ASIA.

A. Turkmenistan (6-478).

urkmenistan (6–478). a. Products: cotton, wheat, fruit, wool, astrakhan fur, carpets; sheep; petroleum, salt, sulphur, soda.

b. Chief Towns: Askhabad (capytal); Merv; Kerkı.

B. Uzbekistan (6-479).

a. Products: cotton, lucerne, food grains. grapes; petroleum, building stone, copper, coal.

b. Chief Towns: Tashkent (capital); Bokhara: Khiva; Samarkand.

C. Tadzhikistan (6-478).

a. Products: cereals, cotton, fruit, cattle and sheep; lignite, mercury, uranium, mica, sulphur.

b. Capital: Stalmabad.

D. Kirghizia (6-478).

a. Products: sugar, hemp, tobacco; sheep, cattle; coal, gold, silver, tungsten, etc. b. Capital: Frunze.

E. Kazakhstan (6-177).

a. Products: coal, petroleum, sugar-beet, cotton, food grams, sheep.

b. Chief Towns: Alma Ata (the capital); Karaganda.

Japan

LESS than a century ago Japan (4-340, map, 4-341) was a closed state, having no interest in the outside world. Its records were settled with them was an district. interest in the outside world. Its people were satisfied with their own englization, and cared nothing tor that of the West. Then, as if by magic, all this was transformed. Within the span of one man's lifetime, Japan became a power in world politics and in world commerce. The Japanese created factories, a powerful navy, a large and officient standing army. A victorious war with Russia, 1904-05, alliance with Great Britain, and a declaration of war on the side of the Allies in the First World War increased its strength. The conquest of Manchuria and the invasion of China followed, and in 1941 Japan bombed Poarl Harbour, forcing the United States of America into the Second World War. Japan surrendered in 1945, and was occupied by U.S. and British Commonwealth troops. In 1952 a peace treaty with former encuries (except Russia) came into force.

I. PHYSIOGRAPHY.

- A. Volcanic Mountains.
 - a. Most prominent peak Mount Fujiyama (4-341, 346, illus.).
 - b. Earthquakes.
- B. Important Lowlands.
- C. Broken Coastlines provide many good harbours.

II. NATURAL RESOURCES AND PRODUCTS.

- A. Agriculture: rice, tea, wheat, barley, rye, tobacco, fruit and vegetables, bamboo.
- B. Mining and Minerals: iron, petroleum, aluminium, sulphur, kaolin clay, coal (abundant but of poor quality).
- C. Forests and Forest Products.
- D. Fresh and Salt Water Fisheries: sturgeon, mackerel, salmon, flounder, halibut, shad, herring, oysters.
- E. Manufacturing: cotton goods, silks, woollens, iron and steel products, matches, toys, pottery, glassware, lacquer-ware, paper, camphor, art objects, ink, machinery, chemicals.

III. CHIEF CITIES.

Tokyo (capital) (7 289); Osaka (6 6); Kobe (4 340); Kyoto (4 426), Nagoya (4 340); Yokohama (7 514).

IV. FORMER POSSESSIONS.

- A. Korea (4-425). Annexed by Japan in 1910, taken from Japan by the Allies 1945. It was intended to make it an independent republic, but the part north of the 38th parallel was made a Communist state by the Russian occupying forces, the part south of the 38th parallel was made a democratic republic by the U.S. occupying forces. When the north invaded the south in 1950, the U.N. went to the help of the south. The country was still divided when a truce was signed in 1953.
 - a. Products: rice, harley, wheat, soya beans. tobacco, cotton; tungsten, graphite, iron, manganese.
 - b. Chief Towns: Seoul; Pyongyang; Pusan.
- B. Formosa (8-423). Seized by Japan, 1895; taken from Japan by Allies, 1945. (See Outline on China, page 104.)

C. South Sakhalin. Ceded by Russia, 1905; restored to Russia, 1945.

D. Other Former Possessions: Kurde Islands, taken by Russia in 1945; Ryukyu Islands, Bonin Islands, occupied by the U.S.A., 1945 (Oshima group returned to Japan, 1953); former Japanese-mandated Mariana, Pelew. Caroline, Marshall 'Islands (American trusteeship, 1947); Kwantung (territory in Manchuria), restored to China, 1945.

China

CHINA (2 361: map, 2 364) has an area of over 3,000,000 square miles, almost exactly the same as the land and inland water area of the United States, and a population half as large again as that of all the Americas. Isolated from the rest of the world by ocean, mountains, and desert, the Chinese reached a high degree of civilization when the peoples of Europe were still burbarians. Following the revolution of 1911-12, China became a republic. Civil war and unrest continued before and after the Japanese invasion of 1937-45 until in 1949 the Communist leader Mao-tso Tung gained control of the whole mainland, and set about re-organizing the country.

I. DIVISIONS OF GREAT CHINA.

China proper occupies the south-eastern corner of the country. The other main divisions are Mongolia (5 236) in the north, Sinkiang (7 331), including Chinese Turkestan, in the west, and Tibet (7 272) in the south-west. Manchuria (5-112) and part of what is now Mongolia was the Japanese puppet state of Manchukuo from 1932 to 1945.

II. PHYSIOGRAPHY.

- A. Plains of China and Manchuria. Rich "looss" soil.
- B. Mountains and Plateaux.
 - a. Klingan Mountains of Manchuria and Mongolia.
 - b. Altar Mountains and the plateau of the Gobi Desert.
 - c. Tian Shan and Kwenlun Mountains enclosing the plateau of Chinese Turkestan.
 - d. Plateau of Tibot bordered on the south by the Himalayas.
- C. Rivers: Yangtze, Hwang, Amur, St-kiang.
- D Island of Hainan (f.-i.).

III. RESOURCES AND PRODUCTS.

- A. Agriculture: rice, wheat, barley, maze, millet, sugar, indigo, tobacco, soya beans, tea, ginseng, bamboo, cotton.
- B. Livestock · pigs, cattle, buffaloes, sheep.
- C. Fisheries.
- D. Minerals and Mining: coal, iron, petroleum, copper, tin, antimony, gold, silver, lead, bismuth.

- E. Silk Industry and pearl fishing.
- F. Manufacturing: textiles, pottery and porcelain; rugs, lacquer-ware, paper, pig bristles.
- G. Transport: there are few railways in China, but the network of rivers and canals, including the Grand Canal, is very important to commerce.

IV. CHIEF TOWNS.

- A. China Proper. Peking (capital) (6·107), Shanghai (7·15); Canton (2·214); Tientsin (7·275); Nanking (5·315); Foochow (f.-i.); Hankow (4·126); Hangehow (4·126).
- B. Manchuria (5-112). Changehun (capital); Mukden; Harbin; Dairon; Port Arthur.
- C. Inner Mongolia (5-236). Huhehot, formerly Kweisui (capital); Ulan Hoto (former capital).
- D. Sinkiang (including Chinese Turkestan) (7-331). Thiwn or Urumchi (capital); Yarkand; Khotau; Kashgar.
- E. Tibet (7 272). Lhasa (capital) (7-272).

V. POSSESSIONS OF FOREIGN COUNTRIES.

- A. Hong Kong (British) (4 191). Chief City, Victoria (commonly called Hong Kong).
- B. Macao (Portuguese) (6-268).

VI. FORMOSA (Taiwan).

The island of Formosa (3 423), off the Chinese coast, a Japanese possession from 1895 to 1945, became the refuge of the Chinese Nationalist Government in 1949.

- A. Products: rice, tea, sugar, sweet potatoes, jute; camphor; coal; fish, livestock.
- B. Capital: Tarpei.

Indo-China and Malay Peninsula

THE territory of South-East Asia between India and China is divided into Indo-China (4-256; map. 4-257) in the east; the Kingdom of Siam (7-45) in the centre, extending down to the Federation of Malaya (5-93); and a narrow strip of Burma in the west.

I. PHYSIOGRAPHY.

Northern highlands spread like a fork down the east and west coasts, enclosing central lowlands and narrow coastal plains.

II. PRODUCTS AND RESOURCES.

A. Agriculture : rice, rubber, maize, tobacco,

tropical fruits, sago, sugar-cane, tapicca, spices, tea, coffee, cotton.

- B. Forests: ebony, rosewood, teak, ironwood, rattan.
- C. Minerals and mining: tin, coal, tungsten, gold, lead, iron, copper, zinc.

III. POLITICAL DIVISIONS.

A. Viet-Nam Republic (consisting of former Tonking, Annam, and Cychin-China) (7 399); Cambodia (2-179); Laos (4-445): (three states within the French Union). Chief towns: Hanor; Hué; Saigon, Pnom Penh; Vientiane.

- B. Siam, 7 45 (independent kingdom). Capital Bangkok (1 361).
- C. Federation of Malaya (5-93, map, 5-94) (British). Capital: Kuala Lumpur.
- D. Singapore Colony (5-94; 7 57) (British). Capital: Singapore (7-56) city.

India and Pakistan

THE sub-continent of India is the home of a population almost as large as that of China, and of a civilization more ancient than that of Europe. It consists of four distinct geographical areas: the Himalayan mountain and hill regions in the north; the river plains of the India, Ganges, and Lower Brahmaphtra; the Decean plateau; and the southern hills called the Eastern and Western Ghats. In 1947 British India was divided into India (4 239; map, 4 238) and Pakistan (6 39), the numerous semi-independent princely states joining one or the other during 1947 to 1950.

I. PHYSIOGRAPHY.

- A. Mountains and Plateaux:
 - a. Himalaya Mountains (4-176) and Hindu Kush on northern border.
 - Baluchistan (1 358) highlands in the extreme west.
 - c. Decean (4 240) tableland in the south, surrounded by the Vindhyn Hills and the Eastern and Western Ghats (f, \cdot, i) .
- B. Plains of Hindustan between northern mountains and Decea.
- C. Rivers: Indus (4 259); Ganges (3 501); Brahmaputra (1 268).

II. CLIMATE.

- A. Tropical in southern half.
- B. Dry, with cold winters, in north.
- C. Moist and cool in Himalayan region.
- D. Immense importance of monsoon (5 248) rains (S.W. in June, N.E. in Madras area in autumn).

III. RESOURCES AND PRODUCTS.

- A India.
 - a. Agriculture: tea, rice, wheat, groundnuts, oil-seeds, cotton, coffee, rubber, sugar.
 - b. Livestock: cattle, buffaloes, sheep, goats, poultry.
 - c. Forests: toak, sandalwood, and other timber.
 d. Minerals: coal, manganese, petroleum, salt, iron, mica, graphite, gold, diamonds.
 - e. Manufactures: cotton cloth, silks, shawls, carpets, wood and metal goods, glassware.
- B. Pakistan.
 - a. Agriculture: rice, wheat, barley, maize, cotton, jute, tea, sugar.
 - b. Livestock : cattle, sheep, camels, buffaloes.
 c. Minerals : coal, chromito, gypsum, limestone, petroleum.

At partition, nearly all the established factories in the sub-continent fell to India. The manufacture of cotton-cloth, paper, jute, glass, woollens, etc., is being slowly developed in Pakistan.

IV. MAIN DIVISIONS AND CHIEF CITIES.

- A. India (independent republic within the British Commonwealth) is a Union of the following States:
 - a. Andhra (f.-i.). Provisional capital: Kurnool.

- b. Assam (1 276). Capital: Shillong.
- c. Bihar (1 444). Capital: Patna.
- d. Bombay (1 514). Capital: Bombay city.
- e. Madhya Union, or Madhya Prudesh (f,-i). Seat of government: Nagpur.
- f. Madras (5 69). Capital: Madras city.
- g. Orissa (f. i.). Capital: Cuttack (pending construction of a new capital at Bhuvaneswar).
- h. Punjab (6-310). Capital: Simla (pending construction of a new capital at Chandigarh).
- Uttar Union, or Uttar Pradesh (7 372).
 Capital: Lucknow; other big cities: Cawnpore, Agra, Benares, Allahabad, Aligarh.
- j. West Bengal (1 428). Capital: Calcutta.
- k. Hyderabad. Capital: Hyderabad city.
- 1. Madhya Bharat. Capital: Gwalior.
- m. Mysore. Capital: Mysore city; seat of administration: Bangalore.
- n. Patiala and East Punjab States Union. Capital: Patiala.
- o. Rajasthan. Capital: Jaipur.
- p. Saurashtia, Seat of administration: Rajkot.
- q. Travancore-Cochin. Capital: Trivandrum.
- r. Ten centrally administered states: Ajmer; Bhopal; Bhaspur; Coorg; Delhi; Hunachal Union, or Himachal Pradesh; Kutch; Manipur; Tripura; Vindhya Union, or Vindhya Pradesh.

The Andaman and Nicobar Islands are centrally administered; the Laccadive Islands are attached to Madras State.

The Capital of the Republic of India is Delhi (3 66) ity, chief part of Dolhi State.

- B. Pakistan (Dominion of the British Commonwealth) has five provinces:
 - a. Punjab (6 310). Capital: Lahore.
 - b. Sind (f.-i.). Capital: Hyderabad.
 - c. North-West Frontier Province (6-41; 4-239). Capital: Poshawar.
 - d. East Bengal (1-428). ('apital: Darca.
- e. Baluchistan (1-358). Chief town: Quetta. The capital of Pakistan, Karachi (4-393), is detached from the surrounding state of Sind and separately administered.

Note: Pakistan is composed of two widely separated parts, one in the N.E. of the sub-continent (the eastern part of Bengal), the other in the N.W.

The state of Jammu and Kashmir (4-398) was the subject of dispute between India (which claimed it because its Hindu ruler chose accession to India) and Pakistan (which claimed it because the majority of its inhabitants are Mushins).

V. NEIGHBOURING STATES AND FOREIGN POSSESSIONS

A. Three semi-independent states, between Tibet and the Republic of India: Nepal (5-366) (capital, Khatmandu), Sikkim (capital, Gangtok), Bhutan (capital, Bumthang).

B. Portuguese India: Gos, Daman, Diu (small settlements held by Portugal against claims by

Republic of India).

Burma

THE Union of Burma (2-130), which hes between Tibet and China to the north, India to the north-west, Bay of Bengal on the west, and China, Indo-China, and Siam on the east and north-east, came into being in 1948. It was formerly British

I. PHYSIOGRAPHY.

- A. Mountains: Parallel ranges running generally north and south form the western hills, central belt, and Shan plateau.
- B. Rivers: Irawadi, Sittang, Salween.
 - II. RESOURCES AND PRODUCTS.
- A. Agriculture in the fertile valleys: chief

erop, rice, also sesamum, groundnuts, cotton, maize.

B. Forests on the mountains yield teak.

C. Minerals: silver, lead, tungsten, petroleum, rubios, sapphires, jade.

III. CHIEF TOWNS.

Rangoon (capital) (6-363); Bassem; Pegu Prome; Bhamo; Moulmein.

Ceylon

THE island of Ceylon (2-297), off the southern tip of the Indian sub-continent, was possessed in turn by the Portuguese, the Dutch, and the British. A British colony from 1802, it became a dominion of the British Commonwealth in 1948

I. PHYSIOGRAPHY.

- A. Plateau and mountains: in south central portion (Adam's Peak).
- B. Plain: in north and north central area.
- C. Rivers: short, unmavigable, some drying up in summer.

II. RESOURCES AND PRODUCTS.

- A. Agriculture: chief crops—tea, rubber, rice, copra, vegetable oil, cacao, cinnamore.
- B. Minerals: plumbago, graphite, gem stones
- C. Pearl fishing.

III. CHIEF TOWNS.

Colombo (capital) (2-459); Kandy, Trincomalee.

Persia (Iran) and Afghanistan

PERSIA (6-129) and Afghanistan (1-46; map, 1-46) occupy the rugged mountains and and tablelands that divide the Near East from Central Asia and the Far East. They are among the least developed of the Asiatic states, having few railways or industries.

I. PERSIA (IRAN).

- A Physiography. The Elburz Mountains in the north, and the vast stretches of the Iranian plateau in the centre and south, are the chief physical features. The Caspian Soa (2-256) forms part of the northern boundary, while, in the south, Persia extends along the Persian Gulf and the Gulf of Oman.
- R. Resources and Products.
 - a. Agriculture and Livestock: wheat, barley, rice, fruits, sugar, cotton, sheep, camels, cattle, goats.
 - b. Minerals: petroleum, iron, coal, copper, lead, manganese, borax, nickel.
 - c. Manufactures: silk, cotton, and woollen materials, carpets, opium, gums, leather.
- C. Chief Towns: Teheran (capital) (f.-i.); Tabriz (f.-i.); Ispahan.

II. AFGHANISTAN.

- A. Physiography. The north-eastern half of Afghanistan is covered by the ridges and spurs of the Hindu Kush Mountains; the south-western half is a continuation of the Iranian plateau, extending over from Persia.
- B. Resources and Products.
 - a. Agriculture and Livestock: wheat, barley, millet, maize, fruits, tobacco, sheep.
 - b. Minerals: copper, lead, iron, soal, silver, lapis lazuli.
 - c. Manufactures : felt, carpets, leather, karakul fur (lambskins).
- C. Chief towns: Kabul (capital) (1-46 illus.); Kandahar (f.-i.); Herat (f.-i.).

Countries of South-Western Asia

BFFORE the First World War this area was part of the Turkish Empire; geographically it may be divided into four large natural regions, as described in the notes below.

I. ASIATIC TURKEY OR ANATOLIA.

- A. Physiography. The plateau of Asia Minor (1-274) constitutes Asiatic Turkey (7 332; map 7-333); it is surrounded on all sides by mountains extending to the shores of the Black Sea and the Mediterranean, the most important being the Taurus Mountains in the south and southeast. (For Turkey in Europe, see page 97.)
- B. Resources and Products.
 - a. Agriculture and Livestock: wheat, oats, barley, tobacco, cotton, opium, grapes, olives, figs: sheep, cattle, goats, asses, horses.
 - b. Minerals: chrome ore, copper. coal, zmc, lead, antimony, manganese, borax, salt, gold, silver, corundum.
 - c. Forests and forest products: timber, gums, wild fruit.
 - d. Manufactures: cotton goods, woollens, silk, rugs, leather, opum, olive oil.
- C. Chief Towns: Ankara (capital of Turkey) (1 156); Ismir (Smyrna) (7 73); Bursa: Trabzon (Trebizond).
- SYRIA (7 217). JEBANON (4 472), ISRAEL (4 302), JORDAN (4 382).
- A. Physiography. Low mountains rise from the Mediterranean coast, except in the extreme south, where there is a strip of coastal plain. Beyond these mountains he narrow river valleys parallel to the coast. Beyond these again lies the great Arabian Desert.
- B Resources and Products.
 - a. Agriculture and Livestock: wheat, maize, barley, millet, fruits, tobacco, cotton, hemp, olives. sheep, goats, cattle, camels, asses, horses.
 - b. Minerals: potash, bromine, phosphates, building stone, basalt.
 - c. Manufacturing: silk and cotton goods, olive oil, petroleum refining.
- C. Chief Towns:
 - a. Syria: Damasens (capital) (3 34); Aleppo (f.-s.); Homs (7 217).

- b. Lebanon: Beirut (capital) (4-472).
- c. Israel: Jerusalem (4-861); 'l'él Aviv-Jaffa (f.-i.).
- d. Jordan: Amman (capital) (4 382, 383 illus.).

III. IRAQ (4-278; map, 4-280).

- A. Physiography. Iraq consists of a lowland plain formed by the valleys of the Tigris (7-277) and the Euphrates (3 306). It is for the most part treeless, and, except along the rivers, is an unproductive desert. However, with irrigation the soil becomes exceedingly fertile.
- B. Resources and Products: wheat, barley, wool, cotton, dates, petroleum.
- C. Chief Towns: Baghdad (capital) (1 346); Basra (4-278); Mosul (4 278).

IV. ARABIA.

The land of Arabia (1 190; map, 1 191) is divided into a group of independent and semi-independent states, the most important being the Kingdom of Saudi Arabia, which includes Nejd, Hejaz, and Asir; Yemen (1 191) along the Red Sea coast: Kinwait (1-191) at the head of the Persian Gulf; and Muscat and Oman (1-191), extending round the eastern tip of the Arabian peninsula from the Persian Gulf to the Indian Ocean. The British Colony of Aden (1 18) occupies the other tip of the peninsula at the mouth of the Red Sea. The Bahrem Islands (1 191) form a separate state, and there are seven other small sheikdoms.

- A. Physiography: Most of Arabia is a great desert tableland, bordered by narrow coastal plains and, in the south, by low mountain ranges.
- B. Resources and Products: dates, livestock, hides, wool, coffee, petroleum, pearls.
- C. Chief Towns: Mecca (5 156); Jeddah; Medma; Riyadh; Muscat; Hodeida; Aden (1-19 illus.).

Indonesia

THE term Indonesia covers geographically the Republic of Indonesia, New Guinea (Netherlands and Australian), and the Philippine Islands. This large group of islands lies between the south-east coast of Asia and the continent of Australia. Malay Archipolago is another geographical term for the same area.

I. PHYSIOGRAPHY AND CLIMATE.

- A. Islands of Volcanic Origin : containing many active and extinct cones.
- B. Typical Formation: Most of the islands have mountainous interiors, cut up by river valleys and surrounded by coastal plains.
- C Hot Equatorial Climate.

II. RESOURCES AND PRODUCTS.

- A. Agriculture and Forest Products: rice, maize, tea, soya beans, spices, popper, coffee, cane-
- sugar, cacao, coconuts and copra, bananas, tobacco, manila hemp, indigo, quinine, rubber, gutta-percha, ebony, teak, sandalwood.
- B. Minerals and mining: copper, iron, gold, tin, petroleum, coal, mercury, precious stones.

III. MAIN DIVISIONS.

- A. Philippine Islands (independent republic) (6-156). Capital Manila (5-118).
- B. Portuguese possession; part of Timor. Chief town Deli.

C. British possessions.

- a. Borneo (2-18).
 - 1. British North Borneo. Capital: Jesselton.
 - 2. Brunoi. Capital: Brunei.
 - 3. Sarawak (6 498). Chief towns: Kuching (capital); Sibu; Miri.
- b. New Guinea (5-395).
 - 1. Papua (Australian). Centre of administration: Port Moresby.
 - N.E. Now Guinea and adjacent islands, administered by Australia under U.N. trustoeship.
- D. Netherlands New Guinea—the western half of the island of New Guinea, all that remains to the Notherlands of its former East Indian Empire.

- E. Republic of Indonesia (4-257; map, 4-258), the former Netherlands Indies apart from western New Guinea. Capital: Jakarta (more familiar as Batavia).
 - a. Sumatra (7-187). Chief towns: Padang. Palembang; Medan.
 - b. Java (4-355). ('hief towns: Jakarta (capital of Indonesia); Bandung (Bandoong). Jokjakarta; Surabaya.
 - c. Madura (4-257).
 - d. Kalimantan, part of Borneo (2-18). Chief towns: Pontianak; Banjermasin; Balik-Papan
 - e. Flores (2-286).
 - f. Part of Timor (f.-i.). Chief town: Kupang
 - g. Celebes (2–286). Chief towns : Macassar : Menado.
 - h. Molucca Islands (5-77; 4-257). Chiestown: Amboyna.
 - i. Bangka, Billiton. Riau Islands, Bali, Lombok.

AUSTRALASIA

A USTRALIA (1 312: maps, 1-316, 319, f.p. 317) is the smallest of the continents. It was the last of the habitable portions of the globe to be explored and settled by white men. Occupying the same latitude as South Africa, it resembles South Africa in many important geographical features, chief of which is the division of the country into an arid western zone and rainy eastern zone. South-east of Australia lies New Zealand (5-422), the largest group of islands in the Pacific outside Indonesia. The remainder of the Pacific islands lie scattered over the vast watery stretches that separate Asia and Australia from the Americas.

I. AUSTRALIA (1 312)

A. Physiography.

- a. Western Australian plateau, including the desert region.
- b. Great central plains.
- c. East Australian highlands, including the Great Dividing Range.
- d. Murray and Darling rivers form the only important river system of Australia.
- e. Coastline smooth, vory slightly indented. Great Barrier Reef.
- f. Tasmania (7-228).

B. Climate.

- a. Typical tropical climate in the north.
- b. Seasonal change in the south; high temperature of the interior.
- c. Rainfall: uncertain and insufficient in the interior and on the west coast; heavy on eastern coast.
- d. Temperate climate of Tasmania.

C. Vegetation and Animal Life.

- a. Typical Vegetation: eucalyptus (3 305); acacia (1-8); tree ferns, gigantic tulips and lilies, tall tropical grasses.
- b. Typical Animals: dingo (or wild dog); kangaroo (4-391); wombat; bandicoot; grey opossum; Tasmanian devil, Tasmanian wolf; duckbill (8-133); spiny ant-eater (1-170); frilled lizard (4-528 f.); laughing jackass; emu; (8-242); cassowary; black swan; lyre bird;

brush turkey; mallee-bird; bower birds (2 28). (The rabbit, though common, is not native.)

D. Natural Resources and Industries,

- . a. Sheep and Cattle Raising the most important industries.
 - b. Agriculture: wheat, oats, barley, maze, hay, sugar-cane, grapes, and other fruit.
 - c. Minerals and mining: coal, gold, silver, lead, copper, tin, zinc, iron, tungsten, uranium
 - d. Manufactures: wool, leather, chemicals, metal products, lumber, wine.

E. Divisions of Australia.

- a. New South Wales (5 402). Capital: Sydney (7 216).
- b. Victoria (7 396). ('apital : Melbourne (5-167).
- c. Queensland (6-322). Cupital: Brisbane (2-71).
- d. South Australia (7-102). Capital: Adelado (1-18).
- e. Western Australia (7-441). Capital: Perth (6-137).
- f. Tasmania (7 228). ('apital: Hobart (4 183).
- g. Territories.
 - 1. Federal Capital Territory, Canberra (2-209).
 - 2. Northern Territory. Centre of administration: Darwin,
- h. Possessions administered by the Australian Commonwealth: Territory of Papua; U.N. Trusteeship Territory of N. E. New Guinea.

II. NEW ZEALAND.

New Zealand (5-422) consists of three main islands (the North Island and the South Island and a smaller one, Stewart Island, near the southern tip of the South Island). The group is situated about 1,300 miles south-east of Australia. Attached to New Zealand are several small islands and island groups, of which the most important are the Auckland Islands, Chatham Islands, Cook Islands, and Kermadee Islands.

A. Physiography and Climate.

a. The North Island consists of plains and plateaux marked by volcanic cones and hot springs.

b. Rugged cloud-capped peaks of Southern Alps on the South Island flanked by the Canterbury Plains.

c. Climate: semi-tropical conditions prevail in the north, while the south is temperate. Rainfall is abundant everywhere.

B. Resources and Products.

- a. Agriculture and Livestock: whent, onts, barley; sheep, cuttle, pigs, horses; wool.
- b. Forests and forest products: lumber and kauri gum.
- c. Fisheries: whaling is an important industry.
 d. Minerals and mining: coal, gold, silver, tungsten, copper, con, silica sand, pumice, limestone.
- e. Manufactures: meat packing, dairy and other food products, clothing, shoes, metal-ware.

C. Chief Towns: Wellington (capital) (7–487); Auckland (1 307); Christchurch: Dunedin.

III. PACIFIC ISLANDS (6 25).

A. Resources and Products.

- a. Wild and Cultivated Products: coconuts and copra, breadfruit, sugar, pmeapples, bangnas, taro, yams, sugo, coffee, rubber, ten, rare woods.
- b. Sea Products: pearl shell, turtle-shell trepang or bêche de-mer.
- c. Minerals: phosphate, nickel.

B. Principal Islands of the Pacific.

- a. Melanesia (6-26). Bismarck or New Britain Archipelago, Solomon Islands, and Santa Cruz (British); Fiji Islands (British); New Hebridos (British and French); New Caledonn and Loyalty Islands (French).
- b. Micronesia (6 26): Maramas or Ladrones,
 Pelew Islands, Carolino Islands, Marshall
 Islands (United States); Gilbert Islands
 (Butish).
- c. Polynesia (6–26): Hawanan Islands (United States); Samoan Islands (United States and British); Ellice Islands, Tokelau Islands, Tonga or Friendly Islands, and Cook Islands (British); Society Islands, Tubuai or Austral Islands, Marquesas, and Tuamotu or Low Archipolago (French).

POLAR REGIONS

SURROUNDING each of the poles of the Earth is a region of extreme cold, where permanent settlement is difficult if not impossible. The North Polar or Arctic Region (1 220) consists for the most part of a great ocean into which are thrust the northern coasts of Europe, Asia, and North America. The South Polar Region or Antarctica (1 163) consists of a vast and lofty land mass out off from other lands by hundreds of miles of open water

I. ARCTIC REGIONS.

Physiography and Climate.

- a. Arctic Ocean; Bering Strait (1 88); Baffin Bay.
- b. Chief Islands within Arctic Circle. Greenland (4 94). Spitsbergen, Fridtjof Nausen Laud, Novaia Zemha, New Siberia, Lenin Land, Baffin Land, Banks Land, Victoria Land. Grant Land, Wrangel Island.
- c. Arctic Plains or Tundras : in North America ; in Europe ; in Asia.
- d. North Magnetic Pole (5 460; 5 83).
- e. Climate. Extreme cold; sunless winters; midnight sun in summer.

Animals and Vegetation.

- a. Sea Life: whale (7-445); dolphin (3 105), seal (6-525); walrus (7-417).
- b. Land Mammals: arctic fox; polar hare, white wolf; polar bear; ermine; musk ox. c. Reindeer, the domestic animal of the North (6 379).
- d. Birds: auk (1-309); eider duck; ptarmigan; sandpiper; snowy owl; tern; teal. e. Vegetation: lichens (4-490); mosses (5-272).

- C. Peoples of the Arctic Regions: Eskimos (3 296); Lapps (4 446).
- D. Natural Resources and Industries: fur-bearing animals; fishing; whating, scaling; walrus hunting; coal.
- E. North Polar Explorations (6 342).

II. ANTARCTIC REGIONS.

A. Physiography and Climate.

- a. High Plateaux and Lotty Mountains. Average elevation as compared with other continents.
- b. South Magnetic Pole.
- c. Severe Antarctic Climate because of altitude of land mass.
- B. Animals. 156.
 - a. Few Birds can bear the rigorous climate: penguin (6 115): petrel (6 146); albatross (1 92).
 - b. Sea Mammals: seal, sca-lion, sea-elephant (6 525); whales (7 -445); dolphin (8 105).
 - c. Vegetation : mosses (5-272); lichens (4-490).
- C. South Polar Explorations (6-344).

NORTH AMERICA

THE Arctic Circle cuts across the American continent far to the north, and the Tropic of Cancer crosses central Mexico. This means that the great bulk of North America (5-452; maps, 5-452, f.p. 453) lies in the temperate zone, with a climate suited to the greatest variety of human enterprises. South America, on the other hand, has its largest area in the tropical zone. In contrasting the development of North and South America it is also important to note that South America was chiefly colonised by Spaniards and Portuguese, who did not regard the New World primarily as a land to be settled and developed, but as a treasure-house to be exploited for the benefit of their governments at home; whereas the English, Dutch, French, and later settlers of North America sought a permanent home in the New World.

I. GEOLOGICAL HISTORY.

- A. Growth of the Continent (5-454).
- B. Formation of Mountain Ranges and Plateaux.
 a. The Laurentian Plateau—extending from northern Labrador to western tip of Lake
 - Superior, and north to the northern plain.
 b. The Appalachian Mountains (1-184)—
 from Gulf of St. Lawrence parallel with
 Atlantic Coast almost to Gulf of Mexico.
- C. Plains.
 - a. The Great Central Plain.
 - b. Northern Plain—between the Laurentian Plateau and Hudson Bay.
 - c. Coastal Plains: The Atlantic coastal plain; the Gulf coastal plain.
- II. RIVERS AND LAKES EAST OF THE CONTINENTAL DIVIDE.
- A. The St. Lawrence System and the Great Lakes.
- B. The Rivers of the Atlantic Coastal Plain.
 - a. Chief rivers rising in the northern division

- of the Appalachians: St. John, Penobscot and Kennebec, Merrimac, Connecticut.
- b. The Hudson.
- c. Chief rivers rising in the southern division of the Appalachians: Delaware, Susquehanna, Potomac, Savannah.
- C. The Mississippi-Missouri System.
- D. The Rio Grande System.
- III. RIVERS WEST OF THE CONTINENTAL DIVIDE.
- A. The Colorado System.
- B. The Columbia System.
- C. The Yukon System.
- IV. RIVERS FLOWING INTO THE ARCTIC OCEAN AND HUDSON BAY.
- A. The Mackenzie-Athabaska System.
- B. The Nelson-Saskatchewan System.

United States of America

THE study of the natural resources of the country and of the multitude of uses to which they have been put are the most interesting and important points in the geography of the United States. From this point of view, the territory may be divided into several natural regions, each of which is particularly adapted to certain classes of industries and occupations. A comprehensive account of the natural resources and industries, as well as of the principal cities, will be found in the article on the United States (7-356). Each state in the Union is also the subject of a separate article.

NOTE: For exact boundaries of natural divisions of the U.S.A., consult map (7-f.p. 356).

I. NORTHERN DIVISION OF THE APPALACHIAN HIGHLANDS.

This region, which includes all New England, is essentially a manufacturing district. The surface of the land is generally broken and rocky; the only portions suitable for farming on an important scale are the narrow river valleys and lake bottoms. While poor in metals, the rock-ribbed hills of the interior yield building stone of great value. An inexhaustible source of power is found in the swift streams.

The principal centres of manufacturing and trade include Boston (2-21), Providence, Worcester, New Haven, Bridgeport, and Hartford.

II. THE ATLANTIC COASTAL PLAIN.

The southern ridges and plateaux of the Appalachian Highlands are separated from the sea by a strip of lowland called the Atlantic coastal plain, composed of layers of soil washed down from the ancient mountains. A natural boundary called the

"fall line" separates this region from that part of the Appalachian Highlands called the "Piedmont Plateau"; here the rivers, emerging from the western hills, plunge in falls or rapids to the plains below, at the same time putting an end to upstream navigation from the sea and providing a rich source of water-power. The Atlantic coastal plain is at once a manufacturing and an agricultural region. Its chief manufacturing and trade centres are grouped round the great matural harbours to the north; its agricultural districts become increasingly important towards the south.

Important towns include New York (5-410), Philadelphia (5-613), Baltunore (1-357), and Jersey City (f.-i.).

III. SOUTHERN DIVISION OF THE APPALA-CHIAN HIGHLANDS.

This is one of the busiest mining and industrial regions in the world. From the ancient seams of the mountains is mined a vast volume of coal that

feeds the furnaces of thousands of factories. Drawing raw materials—iron ore chiefly—from the western districts, and provided with a convenient outlet for manufactured products to the east, this busy territory sets the pace for all other American industrial life.

Pennsylvania produces almost all the United States supply of anthracite, and has important deposits of other kinds of coal, as well as of petroleum and natural gas. The agricultural products of this region are almost as important as the minerals.

The region has many cities, chiefly mining and manufacturing centres, such as Pittsburgh (6-209) and Rochester.

IV. GULF COASTAL PLAIN.

This portion of the coastal plain, for the most part low and flat, is formed by the accumulated sediment of ages. An extremely fertile region, it includes the lower reaches of the vast Mississippi Valley. Most of the population is devoted to agriculture and there are comparatively few large powers.

Cotton is the chief agricultural product of the region, Texas being the leading cotton state, showed by Arkansas and Mississippi. Production and retining of petroleum, and of its subsidiary products, are the cliff industries.

V. CENTRAL PLAINS AND INTERIOR HIGH-LANDS.

This is the great farming region. The vast stretch of cultivable land which forms the upper Mississippi Valloy, the lower Ohio Valley, and the Great Lakes Plain has a surface gently sloping southward and composed chiefly of fertile alluvial and glacial soils. Abundant rains and a warm summer climate favour successful agriculture. The region possesses extensive waterways, water-power, coal, petroleum, natural gas, and other mineral resources, which have helped to turn many of its sections into great industrial districts—among the richest and busiest in the nation.

Of the agricultural crops maize leads, followed by wheat. The Niagara Falls are in this region. Michigan leads the world in the production of motor cars, and Chicago (2 333) is the greatest meat-packing centre. The largest flour mills in the U.S.A. are at Minneapolis.

VI. GREAT PLAINS.

Between the central plains and the Rocky Mountains and stretching from Canada to Mexico lies a broad belt of almost treeless grassland called the Great Plains, for the most part flat or very gently undulating. Most of this semi-arid land is given over to stock-raising. But the wilderness is gradually being brought under cultivation, either with the aid of irrigation or through the special methods of "dry-farming." Coal in great quantities has been found, and petroleum fields have been discovered. There are few large towns.

VII. ROCKY MOUNTAINS.

Rusing abruptly from the Great Plains, the Rocky Mountains form a lofty barrier that comes down from Canada and reaches seven-eighths of the way across the United States towards Mexico. These

mountains constitute the most important watershed in North America, giving rise to the four largest river systems in the United States—the Missouri-Mississippi, the Columbia, the Colorado, and the Rio Grande systems. Vast stores of mineral wealth have been brought to light in these rugged ranges. In the sheltered valleys agriculture and stock-raising flourish, while the swift mountain streams provide vast water-power harnessed for the service of man by the Hoover, Coolidge, and other great dams.

Beautiful scenery is preserved in the many National Parks. Towns include Denver, Cheyenne, and Laramie.

VIII. WESTERN PLATEAUX.

Between the Rocky Mountains and the Pacific Coast Ranges lies a long stretch of broken land, the greater part of which has less than 10 inches of rain a year. There are many real deserts in this region; the soil, however, is extraordinarily fertile, and in those districts where irrigation is possible or where the rainfall is somewhat above the average, fine crops can be grown. While consisting for the most part of high plateaux, this section contains also deep basins, one, Death Valley, being 280 feet below sea level.

The chief natural resources are minerals. Though the amount of agricultural land is relatively small, the yield per acre is high.

IX. PACIFIC RANGES AND LOWLANDS.

Nowhere in the world are the effect of mountains on climate and the effect of climate upon life better demonstrated than in crossing the lofty mountain ranges that separate the western plateaux from the Pacific slopes of the United States. To the east of these ranges is an arid parched region subject to violent changes of temperature, to the west a paradise with ample rainfall, equable temperature, luxuriant vegetation, flourishing fields, great cities, and thriving industries. The secret of this tramendous contrast lies in the fact that when the warm moisture-laden winds from the Pacific strike the mountain ranges they release their moisture among them in the form of rain or mountain snows.

This is the leading fruit producing region of the U.S.A., oranges, lemons, grapes, apples, and other fruits being grown in profusion. Food products and iron and steel products are among the principal manufactures. Near Los Angeles (5-38) is the famous film centre, Hollywood (2-176 illus.); Yosemite National Park (f.-i.) contains magnificent wild scenery.

X. POSSESSIONS OF THE UNITED STATES.

- A. Alaska (1-88).
- B. In the Atlantic: Puerto Rico (6-301); U.S. Virgin Is.
- C. In the Pacific: Hawaiian Islands (4-189); Eastern Samoan Islands; Guam. The U.S.A. holds under U.N. trusteeship the Mariana, Pelew, Caroline, and Marshall Islands, and remains in occupation of the Ryukyu Islands (except the Oshima group) and the Bonin Islands, both formerly part of Japan proper.
- D. Panama Canal Zone (6-58).

CEOGRAPHY

Canada

CANADA (2-195), a country of the British Commonwealth, has an area larger than the United States including Alaska, but is much less developed. The commercial centres on the Atlantic and Pacific coasts, and along the great interior waterways of Canada, present a picture of thriving industry, but in the north are vast stretches of wilderness still untamed. With tremendous natural resources in fertile soil, waterways, waterpower, forests, minerals, and fisheries, Canada is every year taking a more and more important place in the world.

I. POLITICAL DIVISIONS.

(See map 2-f.p. 197).

- a. Maritime Provinces: Nova Scotia (5-469); Prince Edward Island (6 288); New Brunswick (5-393); Newfoundland (5 394).
- b. Eastern Provinces: Quebec (6-820); Ontario (5-512).
- c. Prairie Provinces: Manitoba (5 114); Saskatchewan (6-449); Alberta (1-593).
- d. Western Province: British Columbia (2-80).
- e. Territories: Yukon Territory (7-520); North-west Territories (5-461).

II. PHYSIOGRAPHY.

A. Mountains and Plateaux.

- a. Appalachian Highlands. Extending northward from U.S.A. into maritime provinces of Canada.
- b. Laurentian Plateau. Oldest land formating in North America. Covers more than half of Canada.
- c. Ranges of the Cordillera System in the West. The Canadian Rocky Mountains and the Coast Itanges enclose a great valley and plateau, which run parallel with the Pacific coast from the United States boundary to Alaska.

B. Plains.

Between Laurentian Plateau and Rocky Mountains, the Great Plains include southwestern Manitoba, central and southern Saskatchewan, all of Alberta except a southwestern strip, through the District of Mackenzie.

C. Rivers and Lakes.

a. St. Lawrence River (6-486).

b. Nelson-Saskatchewan system; Red River (flowing into Lake Winnipeg.)

c. Mackenzie-Athabaska system (5-64); Pea e River.

- d. Yukon (7-520).
- e. Fraser (2-80).
- f. Great Lakes (4-68).
- g. Other large lakes: Lake Winnipeg; Great Slave Lake, Great Bear Lake.

D. Coastline.

- a. Deep Fjords and Bays on Coasts of Labrador and British Columbia.
- b. Hudson Bay and Northern Island Groups.
- E. Important Islands: Cape Breton Island; Vancouver Island; Newfoundland.

III. CLIMATE.

- A. Prevailing climate is of "Continental" type, with great variations in temperature.
- B. Influence of Great Lakes.
- C. The Atlantic maritime provinces have comparatively mild climate; the harbours are free from winter ice, but fog prevails in Newfoundland.
- D. On the Pacific coast warm winds from the ocean keep the winters mild.
- E. Hudson Bay district is ice-bound for nine months of the year.
- F. Ramfall: heavy in west, slight in centre, moderate in east.

IV. NATURAL RESOURCES.

- A. Fertile Soil and good grazing land.
- B. Forests. About a third of Canada is covered by forests.
- C. Minerals.
 - a. Sudbury district of Ontario produces most of the world's nickel.
 - b. Most of the world's asbestos comes from Quebec.
 - c. Coal and petroleum.
 - d. Gold and silver.
 - e. Other minerals: Copper, ifon, zinc, lead, cobalt, molybdonite, uranium, graphite.
- D. Fish.
- E. Fur-Bearing Animals.
- F. Waterways and Water-Power. The Great Lakes and the St. Lawrence River form one of the most important systems of water transport in the world.
- G. National Parks. There are some 30 national parks, the largest being Jasper (4,200 square miles).

V. INDUSTRIES.

- A. Agriculture. Wheat is the largest crop; oats, barley, rye, flax, hay, potatoes, fruit; irrigation and dry farming.
- B. Stock Raising, Dairying, and Dairy Products.
- C. Mining. Canada's vast mineral wealth is being developed.
- D. Lumber and lumber products. Wood pulp for making paper is an important product.
- E. Fisheries. The fish caught include cod, hake haddock, alewife, halibut, pollack, mackerel, herring, smelt, shad, sardine, flounder, trout pike, whitefish, pickerel, and sturgeon. Oysterare found in the Gulf of St. Lawrence. Salmon canning in British Columbia. Importance of Newfoundland Banks (5-395).
- F. Fur Industry: this includes trapping will animals and breeding on fur farms.
- G. Manufacturing. The most important manufacturing region in Canada is southern Ontario

VI. COMMUNICATIONS.

- A. Water Transport. In addition to the natural waterways, numerous canals facilitate commerce in Canada. Chief among these are the Welland Canal (f.-i.), the Trent Canal, the Rideau-Ottawa Canal system, the Rideau Canal.
- B. Railways. The chiof railways are the Canadian National and the Canadian Pacific.

VII. CHIEF TOWNS.

A. Seaports: Halifax (4-119); Saint John (6-

- **486**); St. John's $(f.\cdot i.)$; Vancouver (7-878); Victoria (7-897).
- B. River Ports: Montreal (5 255): Quebee (6 321); Ottawa (capital) (6 9).
- C. Lake Ports: Toronto (7 291). Kungston (f.-i.); Hamilton (5 513); Fort William.
- D. Inland Towns: Winnpeg (7 461); Regna (2–195; 6 500); London, Ont. (5 512); Edmonton (3 165); Calgary (2 175).

CENTRAL AMERICA AND WEST INDIES

THE continents of North and South America may be said to be connected by two sets of mountain chains. One of these forms the isthmus called Central America (2 291; map, 2-292). The other is partially submerged, leaving only its loftiest peaks and plateaux exposed. These form the chain of islands called the West Indies or Antilles, the Yucatan Peninsula, and the Florida Peninsula. All of Central America and all of the West Indies, except a few small islands to the north, he in the Tropical Zone.

Central America

I. BOUNDARIES AND AREA.

- A. Geographically, Central America is usually considered a part of North America, although its climate, its plant and animal life, and its people have more in common with tropical South America.
- B. The total area of Central America is 220,440 sq. in. about four times that of England.

II. PHYSIOGRAPHY AND CLIMATE.

- A. Backbone of Mountains belonging to Cordillera Chain, broken by Nicuragua basin.
- B. Atlantic or Caribbean Coastal Region. Generally low and swampy, hot, and unhealthy.

III. PRODUCTS.

- A. Hot Lowland Region. Bananas, mahogany, dyewoods, logwood, chiele gum, coconuts, rice, sesame seed, essential oils.
- B. Upland Region. Coffee, tobacco, cacao, maize, beans, sugar, henequen; gold, silver, lead.

IV. POLITICAL DIVISIONS.

- A. Guatemala (4 101). Chief towns: Guatemala City (capital); Atlantic coast port, Puerto Barrios; Pacific coast port, San José; Quirigua.
- B. Honduras (4–190). Chief towns: Tegineigalpa (capital); Atlantic coast port, La Ceiba; Pacific coast port, Amapala.
- C. Salvador (6 492). Chief towns: San Salvador (capital); Santa Ana; no Atlantic constline; Pacific const ports, Acajutla and La Umon.
- D. Nicaragua (5 430). Chief towns: Managua (capital); Matagalpa, Leon; Atlantic coast port, Bluefields; Pacific coast ports, Cormto and San Juan del Sur.
- E. Costa Rica (2 514). Chief towns: San José (capital); Cartago; Atlantic coast port, Lamon; Pacific coast port, Puntarenas.
- F. Panama (6 b2). Chief towns: Panama (capital and Pacific coast port); Atlantic coast port, Colón.
- G. British Honduras (4 189). Capital: Belizo.
- H. Panama Canal Zone (United States) (6 53).

West Indies

I. POSITION AND AREA.

The West Indies (7 442; map, 7-442) stretch from the entrance to the Gulf of Mexico castward and southward to the coast of South America, forming the northern and eastern boundary of the Caribbean Sea. With the exception of a part of the Bahamas, they lie entirely within the tropical zone. The Bahamas reach within 60 miles of the coast of Florida.

II. PHYSIOGRAPHY AND CLIMATE.

- A. Bahamas consist of coral formations resting on submerged mountains.
- B. Remainder of West Indies chiefly of volcanic formation. Most of the islands have important mountains, sometimes snow-capped. Mont Pelée is an active volcano.

- C. Rolling plains on some islands and low swampy coast lands.
- D. Usually hot and damp with abundant rainfall.
- E. Hurricanes are frequent.

III. PRODUCTS.

- A. Cane-sugar, tobacco, fruits, cotton, coffee.
- B. Rare Woods: mahogany, lignum vitae, ebony, rosewood, logwood, satinwood.
- C. Livestock.

IV. DIVISIONS OF WEST INDIES.

(1) The Bahamas; (2) the Greater Antilles, including Cuba, Jamaica, Haiti, and Puerto Rico; and (3) the Lesser Antilles, including the Leeward Islands, the Windward Islands, Barbados, Trinidad and Tobago, and the chain of small islands

off the north coast of South America, the most important of which form the Curação group.

A. Bahamas (1-847) (British). Comprise more than 3,000 islands and islets. Capital: Nassau. The Turks and Carcos Islands belong geographically to the Bahamas, but are under the government of Jamaica.

B. Cuba (3-6) (Republic). Chief towns: Havana (capital); Camaguey, Cienfuegos; Santiago de Cuba; Guantanamo; Santa Clara; Merianas;

Holguin.

Jamaica (4 887) (British) Capital: Kingston. D. Haiti. This island is divided politically into two parts:

a. Republic of Haiti (4-118). Capital · Port-

au-Prince.

- b. Dominican Republic (8-106). Capital: Ciudad Trujillo. Both ropublic and capital were formerly called Santo Domingo.
- E. Puerto Rico (6 301) (United States). Capital: San Juan.
- F. British Leeward Islands. Principal islands: British Virgin Islands, comprising Tortola, Virgin Gorda, Anegada, Jost Van Dykes, and about 30 smaller islands; St. Kitts, Nevis, and Anguilla; Antigua, Barbuda, and Redonda;

Montserrat. Chief town: St. John, on Antigua Island.

G. French Leeward Islands. Principal islands: Guadeloupe and Marie Galante. Chief towns: Basse-Terre (capital) and Pointe-à-Pitre. Under the Guadeloupe government is included one-half of the island of St. Martin, the other half belonging to the Netherlands.

H. Leeward Islands (United States). Consisting of part of Virgin Islands. Principal islands: St. Croix, St. Thomas, and St. John. (hief town:

Charlotte Amalie.

I. Windward Islands:

- a. Martinique (5-138) (French). Capital: Fort de France.
- b. British Windward Islands. Principal islands: St. Lucia, St. Vincent, Grenada, Dominica. Chief towns: St. George, Castries, and Kingstown.
- J. Barbados (1 366) (British). Capital: Bridgetown.
- K. Trinidad and Tobago (7 317) (British). Chief towns · Port of Spain (capital) and Scarborough.
- L. Netherlands Antilles. Curação, Bonaire, Aruba, St. Eustatus, half of St. Martin (St. Maarten). Capital. Willemstad.

SOUTH AMERICA

SOUTH AMERICA (7-96; maps, 7-96, f.p. 97) is endowed with vast natural resources, every variety of climate and land formation, rich mineral deposits, great rivers, vast forests, and fortile plains. It has several fine cities. Politically, government it the South American republics is unstable, they are prone to revolution and despotism.

I. PHYSIOGRAPHY.

A. Mountains and Highlands.

- a. Andes (1 148), extending along the west coast from Isthmus of Panama to Cape Horn. b. Brazilian highlands or tableland in the
- c. Guiana highlands and plateau in the north.

B. Plains.

- a. Amazon Lowland. Covered with a dense tropical forest.
- b. Guiana Lowlands and Coastal Plain.
- c. Temperate Zone Forests cover portions of south central plains such as the Gran Chaco.
- d. Treeless Grasslands: llanos of Colombia and Venezuela, grasslands of Southern Brazil, Paraguay, and Uruguay, pampas of Argentina; savannas of Guiana.
- C. Rivers and Lakes of South America. All the important rivers of South America empty into the Atlantic Ocean.
 - a. Magdalene in the extreme north (2-457).

b. Orinoco (6-8).

- c. Amazon, with more than 200 tributaries. (1-129).
- d. Tocantins and Sao Francisco rivers (2-49). e. Plata river (1-224, 225), formed by the
- junction of the Uruguay and the Paraná. f. Rio Negro forming the northern boundary
- of Patagonia. g. Lake Titicaca, largest lake in South America (1-507, 508 illus.).
- D. Chief Islands near South America:
 - a. Tierra dei Fuego group (2-357).
 - b. Trinidad (7 817).

- c. Falkland Islands (8 339).
- d. Juan Fernandez Island (3-2, 2-359).
- e. Galapagos Islands (3-498).

II. CLIMATE.

Intensely hot and damp in tropical lowlands and coastal plains; bitterly cold in heights of Andes; temperate in south.

A. Rainfall.

- a. Tropical lowlands east of Andes have heavy rainfall.
- b. Prevailing easterly winds in tropical north deposit their moisture on eastern slopes of Andes, leaving most of west coast arid.
- c. Prevailing westerly winds on Pacific side of Andes blow over cold Humboldt current before reaching coast, and so leave little rain on coastlands; drop snow on high mountains.
- d. Very heavy rainfall in the extreme south.

III. MINERAL RESOURCES

- A. In Northern Andes. Emeralds, platinum, gold, silver, iron, coal, salt.
- B. In Central Andes. Silver, tin, nuclei, copper, tungsten, lead, iron, zinc, vanadium, manganese, antimony, bismuth, sulphur, coal gypsum. borax, nitrates.
- C. In Southern Andes. Coal.
 D. In Guiana highlands. Gold, bauxite, diamonds.
- E. In Brazilian highlands. Diamonds, iron, and gold are most important; others are platinum, thorium, silver, copper, lead, mercury, manganese, coal, and graphite.
- F. North coast. Petroleum.

IV. VEGETATION AND ANIMAL LIFE.

A. Typical South American Plants:

- a. Native Plants: quebracho; brazil-wood; rubber trees; ivory palm; araucarian pine; cinchona (5-93); sarsaparilla; indigo (5-256); tolu balsam; fustio or dye wood; bamboo (1-359); cacao (2-438); coca (6-139); maté (2-46; 4-187); orchids (5-529); giant water-libes (7-428); cotton (2-516); potato (6-273) manioc (7-226; 6-76); tomato (7-290); tobacco (7-286); pineapple (6-204).
- b. Chief Introduced Plants: coffee; sugarcane; oranges; bananas.
- B. Typical South American Animals: monkeys, (5-240); jaguar (4-336); puma (6-304); tapir (7-227); llama (4-530); alpaca (1-119) and vicuña (4-530); pudu or dwarf deer, pampas deer, and gueinal (3-60); peccary, chinchilla (2-377), sloth (7-68); armadillo (1-241): anteator (1-170); vampire bat (1-382); manatee or sea cow (f.-1.); opossum (5-521), rhea (7-97); condor (2-479); toucan (7-301); hoatzin; parrots (6-92); macaws (5-61; 6-92); white ibis; flamingo (3-385); alligator (1-118), matamata turtle; iguana (4-235); teguexin (4-528); boa constrictor (7-74, 75 illus.); anaconda (2-45 illus.; 7-75 illus.).

Countries of South America

- A. Colombia (2-457; map, 2 457). Chief products: coffee, sugar, rice, maize, bananas, hides, platinum, gold, emeralds, silver, iron, salt, petroleum. Chief towns: Bogotá (capital), Medellin, Cali, Barranquilla, Cartagena.
- B. Venezuela (7-884; map, 7-385). Chief products. petroleum, cotton, coffee, cocoa, rubber, sugar, hides, gold. Chief towns: Caracas (capital); Valencia; Maracaibo; Barquisuneto; Maracay.
- C. Brazil (2-45; mm 2-46). Chief product:
 Brazil produces two-thirds of world's coffee.
 Other products: manioc, sugar, hides and leather, maize, rice, cotton, meat, cocoa, to-bacco, beans, oranges, bananas, rubber, timber, diamonds, gold, manganese, chrome ore, mica, coal, iron, salt. Chief towns: Rio de Janeiro (capital) (6-402); São Paulo; São Salvador (Bahia); Recife (Pernambuco); Belem (Pará); Porto Alegre; Manaos.
- D. Ecuador (3-160). Chief products: cocoa, coffee, rice, balsa wood, kapok, vegetable ivory, gold. Chief towns: Quito (capital); Guayaquil; Cuenca.
- E. Peru (6-138; map, 6-139). Chief products. sugar, cotton, rice, cocoa, coffee, wool, hides and skins; quinine, coca and cocaine, copper, coal, lead, zinc, vanadium, petroleum. Chief towns: Lima (capital) (4-507); Arequipa; Callao.
- F. Bolivia (1-507). Chief products: tin, copper, lead, zinc, rubber, quinine, cattle and hides, cocoa, coffee. Chief towns: La Paz (seat of government); Cochabamba; Sucre (the nominal capital).

- G. Chile (2 357). Chief products: nitrates, copper, coal, manganese, silver, tungsten, molybdonum, sulphur, guano; timber, wheat, hides and leather, meat, wool. Chief towns: Santiago (capital) (6 498); Valparaiso (7 375); Concepción; Antofagasta; Iquique.
- H. Paraguay (6-76). Chief products: livestock, mout and hides, yerba maté, tobacco, sugar, quebracho and other tumbers. Chief towns: Asunción (capital) (6-76, 77 illus.); Villarrica.
- I. Argentina (1-223; map, 1-225). C'hief products meat, hides, wool, wheat, maize, hisseed, oats, cotton, sugar, grapes, tobacco, yerba maté, vegetable oils; textiles; petroleum. C'hief towns: Buenos Aires (capital) (2-108); Rosario; Cordoba, La Plata; Tucuman; Santa Fé; Mendoza; Parana.
- J. Uruguay (7-370). Chief products: cattle, sheep, meat, wool, hides and skins, wheat, linseed, barley, rice, onts, grapes. Chief towns: Montevideo (capital) (5-251); Salto; Paysandu.
- K. Guiana (4-101; map, 4 101).
 - a. British Guiana. ('hief products: sugar, coffee, balaus, rum, timber, coconuts, rice. bauxite, diamonds, gold. ('apital: Georgetown.
 - b. Surinam (Netherlands Guiana). Chief products: sugar, bananas, coffee, rice, maize, citrus fruits, molasses, balata, gold, bauxite. Capital: Paramaribo.
 - c. French Guiana. Chief products: gold, rice, maize, sugar, cocoa, manioc, bananas. Capital: Cayenne.

MEXICO

MEXICO (5-186; map, 5-186) is a land of enormous natural wealth, but its resources lie for the most part undeveloped. For its Spanish conquerors Mexico was simply a great mine of gold and silver, a storehouse of rare woods and spices, to be exploited for the benefit of the royal government in Spain, and its favoured representatives. The Indians of Mexico were virtually enslaved. The land won its independence in the early part of the nineteenth century; but a hundred years of political chaos followed before Mexico began to take its due place in world affairs.

I. PHYSIOGRAPHY.

A. Mountains. These form part of the great Cordillera system, and are divided into two principal ranges: Sierra Madre Oriental or Eastern Sierra Madre, and Sierra Madre Occidental or Western Sierra Madre. The central Mexican plateau lies between the two ranges.

B. Coastal Plains. The eastern coastal plain, an extension of the Gulf coastal plain of the United States, broadens out in the south to cover most

of the Yucatan Peninsula (7-517). The coast is low and has no good natural harbours. The western coastal plain is narrow, but has many fine harbours.

C. Rivers. With the exception of the Rio Grando, the rivers of Mexico are of no great size.

II. CLIMATE.

Coastal plains exceedingly hot; central plateau mild; mountains cold. Yucatan and lower California generally hot and dry. Heavy runs in the south, but mountains cut off moisture from interior.

III. NATURAL RESOURCES AND INDUSTRIES.

- A. Rich Soil and extensive grazing lands.
 - a. Chief Food Crops: maize, wheat, beans, sugar-cane, coffee, cacao, fruits, and spices.

- b. Fibre Crops: cotton, agave or sisal plant.
- c. Other Crops: tobacco, guayule rubber.
- d. Stock Raising on the northern plateaux.
- B. Minerals.
 - a. Anthracite coal in Sonora; graphite.
 - b. Metals. Silver, gold, copper, lead, iron, antimony, quicksilver, zinc, manganese.
 - c. Vast supplies of petroleum.
- C. Great Forests of valuable timber.
- D. Manufacturing. Meat-packing, cotton-milling rope and twme, soap, cigars and cigarettes, sugar, rubber.

V. CHIEF TOWNS.

Mexico City (capital) (5-189); Guadalajara (5-186); Vera Cruz (7-390); Monterey; Leon.

Interest-Questions in Geography

What does the name of the Himalaya Mountains mean? 4-176. How did a volcano preserve an ancient civilization? 6-257.

What regulates the rainfall? 6-360

How is rainfall measured? 6-361.

What is the most important agent in shaping land surfaces? 7-429

Why is the Sahara a desert? 6-444.

What makes sand? 6 105

Where can you draw fresh water from the Atlantic Ocean? 1-120

What great continent lies uninhabited by Man? 1 103

In what city are there many floating homes? 2 211

Where is the oldest existing canal? 2-205

Why is the Hwang-Ho called "China's Sorrow"? 4-212

How does a mountain reveal its age? 6-186

How does it happen that some people living on the Equator suffer from cold? 2 400

Where are the Pillars of Heroules? 4-20

How did the Latin Quarter of Paris get its name? 6 79

Where is there a great wall of ice 500 miles long ? -1 164

What makes a geyser spout? 4 15

What made Niagara Falls? 5-429

Why is a rain storm feared in Lima, Peru ? 4-507.

What queer take helps to surface the roads? 7-317

What country is the holy land of three religious? 6 45

Why does the Dead Sea deserve its name? 6 49 illus.

What country produces most of the world's platinum? 6 221

Where do birds eatch fish for their masters? 2-367 illus.

What tiny island was called the Gibraltar of the North Sea? 4-159

Where does there still live a tribe of pygmies? 6-312

How does infertile Chile make the world fertile? 2-358.

Why did Africa remain a dark continent so long? 1-52.

What region leads the world in volcanoes? 2-293

How does manufacturing help to make fogs? 3 405

Why is the Red Sea red? 6 375 In what continent did the human race probably originate? 5-203

What causes earthquakes? 3-152

What single river basin is almost as large as the United States? 1-130.

Which is the longest mountain system? 1-148.

What country is supported by gambling? 5-250.

What Canadian port is nearly 1,000 miles from the sea ? 5-255

What country has more canals than railways? 5-377.

What French port was benefited most by the opening of the Sucz Ganal? 5-137.

What sea was the first to be navigated by white men? 5-166
What important French river flows through a natural tunnel too
three miles? 5 185

Which is the smallest county in England? 6-482

What wild animals are still at large in Europe? 3-312

Which is Britain's highest mountain? 1 130

What places have the greatest and smallest variations in temperature?

Where are there famous hot springs? 4 15

Of what country is the old Kingdom of Bohemia part? 3-21

Which is Canada's chief winter port? 6 186

Where is the world's largest cave? 2 276

How did Florida get its name? 3-393

In what part of the British lales is French the official language?

What is the largest city in South America? 2-104

Where are the most dangerous volcances in America? 6-493

Where are the world's chief gold-fields? 4-39

Which is Great Britain's longest river? 3 247.

Which is the largest city in India? 2-172

How dld Carolina get its name? 2-244

Which is Europe's "oldest state"? 6-497.

Where is the heaviest rainfall? 2-410, 4-240.

What is another name for Shropshire? 7 44.

Which is the deepest ocean? 6-25

Where is the Atlantic west of the Pacific? 6-54.

What is the Garden of the Gulf? 6-288.

Which is the City of Steel or Iron City of the U.S.A. ? 6-200

What is a hacienda? 2-293

What did Khufu build? 6-312.

Where is the Gran Chaco? 1-507.

Is Buda or Pest the older part of Budapest? 2-105.

a but of rest the older part of budghest . S-100

What was the Polish Corridor? 6-241.

Where and what is the heating apparatus of N.W Europe? 4-103

How long is the Khyber Pass? 1-46.

Can you tell a Persian from a Turkish carpet? 2-\$46.

What is the Heidelberg tun? 4-157.

Where are the Fortunate Isles believed to be? 2-208.

What are Rum, Eigg, and Muck? 4-275.

Where is "la ville lumière"? 6-79.

What is Hull's full name? 4-202.

Where is the "city of peace"? 4-361,

Which is the Keystone State of the U.S.A.? 6-119.

What is "Peruvian bark" used for ? 6-141.

HISTORY (4-180) occupies a very important place in the field of knowledge, for an understanding of current world affairs social, political, and economic must be based on a knowledge of their historical background. History, as it is taught and written to-day, is no longer a narrative of isolated incidents, of wars and intrigue, or marriages and deaths of kings and queens, or of the detached deeds of famous men and women. Buther it is an account of the origin and development of human institutions and ideas. It deals with the conditions under which ordinary men and women lived in various ages and countries; it deals with their customs, arts, and ideals, with the growth of law and government, and with the influence of leaders upon the fate of peoples, and of popular discontents on the fate of rulers. Fuller and wider knowledge of history should, and may, help mankind to avoid repetition of some at least of his past mistakes. The History Charts (8 134) show what was happening in different countries at the same time.

ANCIENT HISTORY The Dawn of Civilization

I. PREHISTORIC PERIOD.

For thousands of years before the oldest kind of writing was invented, men and women and children had been working and playing in many parts of the world. Careful study of the things they left stone tools, pieces of pottery, pictures on cave walls has reveled a great deal about the way these people lived, and the almost unbelievably slow steps by which they learned the arts of excitation have been traced. But, because they lived before there was any uritten history, they are called prehistoric men.

- A Stone Age Man (7-161).
 - a. Eolithic Age (5 106, 7 162).
 - b. Old Stone or Palaeolithic Age (5 106; 7-162).
 - 1. Cave Dwellers (2 282).
 - 2. Remarkable artistic ability; drawings (5.78; 2.279 illus; 5.104 seq.).
 - c. Mesolithic Age (7-163).
 - d. New Stone or Neolithic Age (7-163; 5-106).
 1. Beginnings of settled life and division of labour.
 - 2. Interesting remains. Lake Dwellers, (4-439).
- B. Dawn of History with Bronze Age.
 - a. Discovery of Metals quickens march of progress (2 92; 5-109; 2-73).
 - b Invention of Writing ends Prehistoric Age. •

II. DEVELOPMENT OF CIVILIZATION ALONG . THE NILE.

- A. Favourable Situation of Northern Egypt (3-183). The fertile strip of the Nile Valley, protected on all sides by deserts and the sea, was an ideal situation for the beginnings of civilization. The rich soil brought down by the Nile supported a dense population; the river itself was a great highway; the quarries of the neighbouring deserts furnished unlimited building materials.
- B. Great Epochs of Egyptian History. The History Chart at the end of this Outline should be consulted.
 - a. Long period of Early Development culminating in the union of Upper and Lower Egypt.

- b. Pyramid Age. The building of monumental Pyramid tembs to gratify the vanity of the Pharach's became the dominant interest, exhaust d the wealth, and took a terrific toll of the slave labour (3–193) of Egypt.
- c. Feudal Period when nobles ruled vast estates. During a long struggle between rival rulers and sections Egypt became so weak that it fell before the Hyksos, who were of Asiatic origin.
- d. Defeat of the Hyksos Kings and Rise of the Empire.
 - 1. Egyptian nobles rebelled against the Hyksos and drove them out (c. 1580 n.c.).
 - 2. Great Temple of Karnak crowned revival of art (3–186 illus).
- e. Fall of the Empire. Pursuing the Hyksos Kings into Asia, the Egyptians began a period of foreign conquest, which for many centuries added to Egypt's glory, but which eventually led to the avasion and subjugation of Egypt, first by the Assyrans (671 a.c.) and later by the Per ians (525 a.c.). With these invasions ended the period of distinctive Egyptian culture.

Note: The Egyptian rulers are often grouped into dynasties beginning with the half-legendary Menes (c. 3200 B.o.). The IVth Dynasty marked the height of the Pyramid Age; the XVIIIth began and the XXXIst ended the Imperial Period.

C. How the Ancient Egyptians Lived.

- a. Religion (3-183).
 - 1. Belief in a life after death shown by careful preservation of bodies (mummies: 5-295) and building of suitable tombs.
 2. Gods and sacred unimals (2 263; 3-199; 4 301; 6-6).
 - 3. Priesthood.
- b. Industrial Life. Agriculture (1 71); boats and ships (7-28; 3-204); tanning (4-466); glassmaking (4-30); fishing (3-378); furniture (3-490); papyrus (6 62).
- c. Art and Science. Architecture (1-209); astronomy (1-278); writing (1-120 illus.); painting (3-194, 195, 199 illus.; 6-33); sculpture (6-520; 2-89 illus.; 3-184 et seq.).

III. EARLY CIVILIZATIONS OF WESTERN ASIA.

That part of Asia to-day called the Near East (sometimes the Middle East), and consisting of Asia Minor, Syria, and the Arabian Peninsula, was the ancient home of civilizations that had a profound influence upon subsequent culture and history. These civilizations grew up in what has been called the Fertile Croscont, consisting of that borderland between the mountains on the north and the Arabian desert where crops could be grown and cities built.

- A. Mesopotamia (5 175) or Iraq -the eastern part of the Fertile Crescent (map, 8-183).
 - a. Sumerian Culture. The Sumerians (a non-Semitic people), in their group of city states along the rivers Tigris and Euphrates, originated the characteristic culture of Mesopotamia which was to endure through centuries of conquest. Cuneiform writing (1-336; 1-119 illus; 5-176; 6-129).
 - b. Babylonian Empire (1 336). Established by Semitic tribes who conquered Sumerian cities. The conquerors absorbed and modified the Sumerian culture, developing a highly organized social and political system. Brickmaking (2-57); writing (1 336); painting (6-33); music making (5-302); creation story and Genesis (1-15).
 - c. Assyria absorbs Babylonia in Great Assyrian Empire (1-335; 5-176).
 - 1. Improvements in art of warfare make possible the conquest of a vast military empire; introduction of iron weapons increases fighting efficiency.
 - 2. Hittites (3-200) and Israelites (4-374) conquered.
 - 3. Nineveh, the capital built by Sennacherib (5-440).
 - 4. Artistic advance especially marked by sculptures depicting the conquests; use of stone in building; painting; engraving; library at Nineveh (2-2).

Note: It is important to keep in mind that slavery was an essential part of all ancient civilizations; the people of conquered cities and tribes were made captive, and formed the slave class without which the great buildings of the time could not have been constructed.

- d. Chaldean Empire (1-338).
 - 1. Babylon rebuilt; the hanging gardens, one of the "seven wonders" of the ancient world (7-1, 1-illus. f.p. 336); Nebuchadnezzar's canal (2-205).
 - 2. Babylonian captivity of the Jews, which advanced Hebrew culture (1-339).
- B. Syria—the western end of the Fertile Crescent.
 - a. Phoenicians (6-160)—the early traders who carried the alphabet to all civilized lands. Although they had built their cities on the "battleground of empires," these peaceful merchants suffered little from the successive conquests, for they were content to pay tribute to any conqueror as long as they were allowed to continue their trading enterprises. b. Hebrews (4-873) a people who retained
 - an intense tribal and religious unity despite conquests and oppression.
 - 1. Nomadic wanderings begun by Abraham (1-5); terminated by Moses (5-270).
 - 2. Kingdom established under David (8-58) and his son Solomon (7-88); capital is Jerusalem (4-861).
 - c. Philistines (6-157). This tribe of ancient Canaan was long the enemy of the Israelites (4-374).

C. Asia Minor.

- a. Hittites (3-200). Through their wars with the Hittites the Assyrians and Egyptians learned the use of iron for tools and weapons, and the value of the horse.
- b. Lydians. These people of Asia Minor rose to such prosperity that the name of their king, Croesus (2-583), is still the symbol for fabulous wealth; carliest known use of coins.
- D. Indo-European supremacy supplants Semitic power. The Indo-European peoples moving southward from the mountains north of the Fertile Croscent were of the same blood as the peoples of modern Europe.
 - a. The Medes (5-159).
 - b. The short-lived Persian Empire (6-129).
 - 1. Religion of Zoroaster, the first universal religion (7-527).
 - 2. Rising power of Greece stays westward tide of Persian conquest (4-73; 6-129).
 - 3. Alexander's conquest ends great Asiatic Empires (1-98).

Greeks came down from the unknown north and conquered the Aegeans; adopted much of the

Aegean culture. The Greeks were a morthern

branch (Indo-European) of the same stek as the Medes and Persians (Indo-Iranians) who had in-

The Greeks

- I. THE RISE OF EUROPEAN CIVILIZATION.
- This civilization Aegean Civilization (1-22). developed in Crete and spread over the Aegean
 - a. Effect on European civilization (map, 1-22). The islands of the Aegean were the stepping-
 - at Knossos and elsewhere (1-25, 23 illus.
 - 24 illus.).
- II. GREEK INVASION OF THE AEGEAN WORLD. A. Nomad tribes from the North (1-24).
- stones that brought civilization to Europe. b. Discoveries of archaeologists. Excavations
- B. Times described by Homer mark the high tide of the migration (4-71; 4-189).

vaded the Semitic world of western Asia.

- a. Trojan War (7-320).
- b. Culture of the Achaeans. An account of the culture of these early Greeks is preserved in the Iliad and the Odyssey of Homer.

- III. DEVELOPMENT OF GREEK CITY STATES.
- A. Lack of unity among the Greeks. This is the keynote of Greek political history, and was due to geographical influences.
- B. Evolution of Democracy (4-76; 8-70; 1-288).
 - a. Athens the intellectual leader of Greece (1-287). Reforms of Solon make government more democratic.
 - b. Sparta, the military state (7-123). Lycurgus, the great law-giver (7-124).

Note: It must be remembered in discussing Greek democracy that it was limited to an aristocratic class, the citizens of the states. In the Greek cities the greater part of the menial and skilled labour was done by slaves and free men who were not citizens.

IV. PERSIAN WARS.

- A. Greece checks Persian invasion and saves Europe from Asiatic domination (4-73; 6-129).
 - a. Famous battles: Marathon (6 130); Salamis (f.-i.); Thermopylae (7 268).
 - b. Leaders: Themistocles (f.-i.); Aristides (1-227).
- B. Results of the Wars. They led to the foundation of the Delian League (4-76), which became the Athenian empire.
- V. AGE OF PERICLES (1-287; 6-125)—THE "GOLDEN AGE" OF GREECE.
- A. "Plain living and high thinking" in ancient Athens.
- B. Far-reaching effects of this period. It served to crystallise all the previous culture of Greece; it stimulated new and immortal achievements; and it established such high and firm standards in art, literature, and philosophy that Greece continued to be the intellectual leader of the world long after the political power of the Greek states was broken.

VI. CULTURE OF THE GREEKS.

- A. Literature (4-92).
 - a. Poetry: Homeric epics (4-93); lyric poetry (4-93).
 - b. Drama: evolved from dialogues and choruses of religious festivals (4-93; 7-263).

- Aeschylus (1-45); Sophocles (7-85);
 Euripides (3-807); Aristophanes (1-227).
 Greek Theatres (7-263).
- c. Prose: developed by historians and orators (4-94).
 - 1. Herodotus, the "father of history" (4-170).
 - 2. Demosthenes, greatest of orators (3-70).
- B. Art (4-89) and Architecture (5-532; 531 illus.).
 a. Pheidias, the master sculptor and builder (6-153; 3-228; 4-89; 1-12).
 - b. Glories of the Acropolis (1-12; 4 82 illus).
- C. Music Among the Greeks (5-302).
- D. Influence of religion. A survey of the Greek gods and goddesses will be found in the Mythology Outline (8-156). See also Olympic Games (5-508; 4-71); Oracles (f.-i.; 8-69).
- E. The work of the Philosophers (6 160). Socrates (7 81); Plato (6-222); Aristotle (1 228).
- VII. CIVIL WARS AND DECLINE OF THE POWER OF THE CITY STATES.
- A. Peloponnesian Wars (4-77; 7-124) establish Spartan supremacy.
- B. Leadership Passes to Thebes (7-266).

VIII. GREECE UNDER MACEDONIAN RULE.

- A. Philip of Macedon (7-267; 4-77; 1-98) builds up a great military power.
- B. Alexander (1-98), Philip's son, becomes a world conqueror.
 - a. Subjugation of Persian Empire, including Egypt (6-131).
 - b. Alexander carries Greek culture to most of known world.
- C. Sunset glory of Greece—the Hellenistic Age (4-77).
 - a. In Egypt. Alexandria (1-101; 3 200) becomes literary and scientific capital of world.
 - b. Art and Literature of Hellenistic Age (4-91; 1-209).
 - c. Development of Science (4-92; 5-299).
- IX. GRECIAN WORLD ABSORBED BY ROMAN EMPIRE (6-430).

Rise and Fall of the Roman Empire

I. BEGINNINGS OF ROME.

- A. Sunny Italy: the generous mistress of the Mediterranean. Italy was more hospitable than Greece to the enterprises of men. The sunny hillsides of the Apennines sloping to the western Mediterranean could support a large population; communication was not difficult. If the lack of good harbours tended to keep the early Romans at home, it also kept invaders away.
- B Inhabitants of ancient Italy.
 - a. The Etruscans (3-305), who seem to have had close connexion with Asia.
 - b. The Latins (6-429). Entered Italy from north, belonged to same stock (Indo-European) as invaders of Greece.
- C. Founding of Rome. Nothing definite is known

- of the founding of Rome, as there is little historical evidence to support the legends of Aeneas (1-25) or of Romulus and Remus (6-429; 5-136).
- D. Progress and prosperity of Rome under Etruscan rule (6-429).
- E. Etruscan Kings expelled (6-430). Story of Horatius (6-420; 5-59; 2-62).

II. THE REPUBLIC.

- A. Long fight waged by common people (Plebs) against the ruling aristocracy (Patricians) for political power (6-429).
- B. Military conquest and territorial expansion.
 - a. All Italy comes under Roman rule.
 - 1. Defeat of Pyrrhus at Beneventum leads to capture of Greek colonies (6-314; 6-430).

- 2. Wise political organization of conquered territories aids governmental stability (2-388).
- 3. Story of Cincinnatus (2-388).
- b. Triumph in Punic Wars gives Rome naval supremacy.
 - 1. Casthage—its rise and fall (2-255).
 - 2. Hannibal n genius in victory and defeat (4-127; 2-255; 6 232).
- c. Other Conquests. With Carthage defeated, the way was now clear for the conquest of a Mediterranean empire; victory followed victory; and sooner or later most of the known world fell before the Roman legions: Syracuse (1-208); Spain (7 105); Greece (6 430); the East (6-258); Gaul (3 433).

C. Collapse of the Republic.

a. Civil War, a period of personal rivalries and class struggle (6 433); Spartacus (f.-i.) slave revolt. During this period many famous characters appeared: Cicero (2 387); Pompey (6-258); Antony (5-129) and Cleopatra (2 407).
b. Julius Caesar masters the Roman world

b. Julius Caesar masters the Roman worl and becomes "Imperator" (2 161; 6-433).

III. THE EMPIRE.

A. First Century of Imperial glory.

- a. Augustus (1-308) encourages intellectual and Imperial development.
- b. Nero (5 367), last of the Augustan line, ends the contury.
- B. Second Century of Imperial glory: empire reaches greatest extent (map, 6 433).
 - a. Conquest of Britain (2 73).
 - b. Destruction of Jerusalem (6 45).
 - c. Marcus Aurelius, the Emperor-philosopher (5 128).

C. Life in Imperial Rome.

- a. Luxury the keynote of Roman life. Everyday affairs in Pompeii (6 256); performances of gladiators (4 25; 2-404).
- b. Practical Progress.
 - 1. Modern improvements two thousand years ago: public baths (6-429 illus.); aqueducts and water supply (1-188; 6-446 illus.).
 - 2. Greatest system of communication in the ancient world: roads (6-404); postal service (6-270); lighthouses (4 502).
- c. Artistic Achievements.
 - 1. Roman architects modify Greek style

and develop engineering technique (1-209). 2. In sculpture and painting also, the Romans followed Greek models (6-520).

d. Latin Language and Literature (4-449).

- Golden Age of Latin literature: Cicero (2-387), the great prose stylist (4-450);
 Horace (4-193) and Virgil (7-402), poets.
 Silver Age. "Meditations" of Marcus Aurelius (5-123), a classic of all ages.
- e. Religion. In religion, too, the Romans borrowed from the Greeks. For a survey of Roman gods and goddesses, consult the Mythology Outline (8 156).

IV. DECLINE AND FALL OF THE EMPIRE.

A. Internal Decay.

- a. Emperors under control of army.
- b. Constantine (2 488) ends the political power of Rome by removing capital to Byzantium and building Constantinople (2 148).
 - 1. This paved the way for the formal division of the Empire (6-439).
 - 2. Justinian I preserves Roman Law in fumous code (2 148; 4-457; 5 199).
- c. The Byzantine Empire (2 148) at Constantinople. This empire is chiefly interesting in connexion with Roman history because it preserved for posterity the classic culture that was destroyed in Rome.
- B. The Coming of the Barbarians: Beyond the last Roman outposts restless peoples were ever eager to push into the southern lands of sunshine and plenty. Centuries before, the Gauls had ravaged Italy and even sacked Rome (6 430). With the weakening of the Roman military power these tribes began to pour into the Empire.

C. Fall of Rome.

- a. Visigoth victory at Adrianople foreshadows doom of Rome (4 49).
- b. Rome is captured by Alaric (4-49).
- c. Pope Leo I saves city from ravages of Hunsunder Attila (4 208; 1-306).
- d. Theodoric the Ostrogoth establishes short-lived rule in Italy (4 49).
- e. Vandals plunder by land and sea (7-379).
- f. Lombards found kingdom in Northern Italy (5-19; 4-306).
- D. The Christian Church takes up the burden dropped by the dying Empire.

MEDIEVAL HISTORY

I. CHARLEMAGNE'S EMPIRE.

A. Foundation of the Frankish Empire.

- a. Clovis (3-449) unites all Franks and conquers land that is modern France. The conversion of Clovis to Christianity (5-199) led to Frankish support of the Pope.
- b. Charles Martel (2-309) saves Europe from Mahomedan conquest at Tours.
- B. Charlemagne (2-305), the empire builder of the Middle Ages.
- C. Disruption of Charlemagne's empire the starting point of modern Germany and France. Charlemagne's scn. Louis the Pious, was unable to maintain order in the vast domain left to him, and upon his death his three sons divided his lands between them—the Partition of Verdun (3-313, 387, 449; 4-5,188). Louis the German

received the portion east of the Rhine; Charles the Bald, that west of the Rhone and Scheldt, Lothair, the middle strip including north Italy.

II. THE MEDIEVAL CHURCH.

- A. Bishop of Rome, as Pope, becomes the most powerful ruler of the Middle Ages (4 306).
- B. Work of the monks and monasteries (5 243).
 - a. Preaching order of Dominicans (4 263).
 - b. The Friars, begging orders (5 245, 244 illus.), including Franciscans (3 457).

III. FEUDALISM.

- A. The Feudal System (3 348) grew up after the collapse of Roman government.
 - a. General causes of feudalism. This system was not peculiar to Europe, it has often grown up in countries where the central government has been weak, e.g. in Japan (4 - 344)
 - b. The castle (2 256) was the stronghold of feudalism.
 - c. Rule of "might makes right" general in England, France, Germany.
- B Life under the Feudal System.
 - a. Knighthood and chivalry (4 417).
 - 1. Armour (1 "43) heraldry (4 164)
 - 2. Life in the custle (2-256), the importance of the minstrels, courtly sport of falconry (4 141)
 - b. Country life. System of land holding (3 348), dependent position of serfs (7 65), agricultural methods (1-70 illus., 72-73)
 - c. Town life. Fans and markets (2 404), Flomish wool trade (4-203), Hanseatic League (4 128), guilds, medioval organiza tions for protection of trade and industry (4 103).
- C Decline of Feudalism. Black Death (1 478) breaks down agricultural system (1-77), effects of Crusades (3 1), Peasants' Revolt (7 339; 7 505), invention of gunpowder (4 418), rise of infantry and professional armes (1.68), invention of printing (2 283, 284; 4 486).

IV. CULTURAL DEVELOPMENT OF THE MIDDLE AGES.

- A Literature embodied in Minstrels' Songs.
 - a. Survivals: Tales of King Arthur (1-256), Robin Heal (6 416), Song of Roland (4 431, 454).
 - b. Froissart the Chronicler (3 477).
 - c. Books (4-488 illus.) and Libraries.
- B. Beginnings of the Modern Drama. Pageants, Miracle and Mystery Plays (3 317).
- C Architecture and Art.
 - a. Gothic architecture (1-211), cathedrals (2-264), stained glass; sculpture (6-520).
 - b. Other arts. Painting; tapestry making (7 224); ivory carving; illumination of books (5-116, 117).
- D. Living Conditions. Meagre house furnishings and floor coverings; inadequate and often impure water supply; bread (2 50); meals (5-152); medicine (5-304); bad roads (6-490).

- E. Education carried on by the Church.
 - a. Medieval universities (7 367, 368).
 - b. Importance of Abélard (1-8) and Roger Bacon (1 341).

V. THE CRUSADES.

- A. The East at the time of the Crusades.
 - a. Byzantine Empire, the stronghold of culture in Europe.
 - b. Rising tide of Islam, or Mahomedanism
 - Movement into Europe through (5.87).Spain (7 105) checked at Tours in 732 (2 309).
- B. The Crusades (3 1).
 - a. Causes. Seljuk Turks capture Jerusalem, threaten Constantinople, and stop pilgrimages to Palestme.
 - b. General character.
 - 1. Famous leaders Richard the Lionhearted (6 398); Saladin (6 488); Louis IX of France (5 41), Frederick Barbarossa (3 2), Philip Augustus (6 155; 3 2).
 - 2. Comption into economic crusades
 - 3 Part played by Crusading Orders (3 2: 4 418).
- C. Effects. Agriculture improved by introduction of new plants, use of so called Arabic (really Indian) notation (5 90, 475; 4 250).

VI. GROWTH OF MONARCHY IN FRANCE.

- A. Capetian Kings begin Unification of France (3 449). When Hugh Capet came to the throne, the kingly power was disputed by great barons, of whom the Duke of Normandy was the most powerful, Henry I fails to subdue vassals; how the Northmen conquered Normandy (3–314),
 - a. Louis the Fat brings order to France by defeating feudal barons (5 40).
 - b. Philip Augustus conquers Normandy from John of England (3 419) (Normandy and England had the same ruler after the Duke of Normandy conquered England in 1066)
 - c. Louis IX's administrative reforms (3 450).
 - d. Philip the Fair calls the first States-General (3 467)
- B. Hundred Years' War (4 203).
 - a. Cause . English claims to Franco.
 - b. How the war was fought.
 - Royal leaders (4 203).
 - 2. Important battles: Crécy (2 527.
 - 4 204); Poitiers (4 204, 203 illus., 1-480); Agmcourt (1 68, 4 163, 204); first use of cannon.
 - 3. Joan of Aic (4 376; 2 308, 4 204) saves France.
 - c. Effects in France (3 450).
- C. Growth of Absolute Monarchy under Louis XI (5 41, 2 309; 3-314). Defeat of Charles the Bold, Duke of Burgindy (3 387; 2-97; 5 41). Note: For Outline of the history of England in the Middle Ages, see 8-127.

VII. THE EMPIRE AND THE PAPACY.

- A. The Beginnings of the Holy Roman Empire (4-187).
 - a. Coronation of Charlemagne, the "central fact of the Middle Ages " (3-450 illus.).

- b. Conflict between Popes and Emperors (4-308). Since both Pope and Emperor claimed that their power was derived from God, a difference in interests was bound to lead to a conflict.
- c. Revived under Otto I (4-7; 8-314; 4-188). For the next few conturies the history of Germany and of Italy became that of the Empire and the Papacy.
- B. Great Investiture Conflict.

 Begun by the Emperor Hehry IV and Pope Gregory VII (Hildebrand) (4-96; 4-308). Settled by Concordat of Worms.
- C. Quarrels of the Hohenstaufens and the Popes.
 - a. Fundamental causes. The office of Emperor was theoretically elective, and the Guelfs disputed the claims of the Hohenstaufens (Ghibellines). Since the coronation of the Emperor by the Pope was necessary to the imperial power, the Pope was forced to take sides in the disputes. The Hohenstaufens were the most formidable rivals of the papacy.

- b. Frederick Barbarossa, one of the greatest of the emperors (4-7).
- c. Innocent III strengthens the papal position, humbles John of England (4-378).
- d. Frederick II (4-7) restores Hohenstaufen House; cultural development of this period in Naples and Sicily.
- D. Golden Bull establishes a "Constitution" for the Empire (4-8); hinders growth of centralised government in Germany.

VIII. FALL OF THE EASTERN (BYZANTINE) EMPIRE.

- A. Rise of the Ottoman Turks (7-333).
- B. Fall of Constantinople (2-149). This put an end to the Byzantine Empire and gave the Turks undisputed control of the eastern Mediterranean and of a large corner of Europe; it stimulated the era of exploration and discovery by forcing western Europe to seek new ways of reaching the Far East.

MODERN HISTORY

The Renaissance

- I. FORERUNNERS AND CONTRIBUTING CAUSES.
- A. Crusades (8-1): Contact with Eastern culture stimulated thought of Crusaders.
- B. Invention of Printing (6–288; 4–486) and more general use of paper promoted interchange of ideas.
- C. Growth of Creative Impulse as shown in Medieval Architecture (1–209).

II. LITERARY RENAISSANCE.

Study of classical learning and beginnings of national literatures (6-384).

- A. In Italy (6-384).
 - a. Dante (3.45), the forerunner of the Renaissance.
 - b. Revival of Greek and Latin hampers distinctly national literature (6-384, 386).
- B. North of the Alps (6-386, 387).
 - a. France: Froissart the Chronicler (8-477; 8-455, 454 illus.).
 - b. England (6-387): early influence of Chaucer (2-811), and Wycliffe (7-505) on English language; Sir Thomas More (5-262; 3-124 illus.) and the Oxford Reformers.

III. ARTISTIC RENAISSANCE.

- A. In Italy (6-368).
 - a. Florence the centre of the movement (4-313, 317); patronage of the Medici (5-160).

- b. Italian Masters: Giotto (4 21); Ghiberti (f.·i.; 3-392); Leonardo da Vinci (4-482); Michelangelo (5-190); Raphael (6-363); Titian (7-282); etc. c. The Church a patron of art: The Borgias (2-17); Leo X (5-160).
- B. Northern Artists: Durer (3-138); Holbein (4-185; 3-259).
- C. Architecture: Return to the classic styles (6-386).

IV. BEGINNINGS OF SCIENCE.

- A. Roger Bacon (1-341) who foreshadowed experimental science.
- B. Advance in Astronomy:
 - a. Copernicus (2-501), the founder of modern astronomy.
- b. Galileo (3-498; 5-162; 4-330) continues work of Copernicus.
- C Important Inventions: compass (2-474); gunpowder (8-329).

V. EXPLORATIONS AND DISCOVERIES.

- A. Prince Henry the Navigator (f.-i.) and the Portuguese in the East (4-251; 2-297).
 - a. Bartholomew Diaz discovers the Cape of Good Hope (1-53; 2-215; 7-89).
 b. Vasco da Gama reaches India by sea (7-382).
- B. Columbus (2-467) discovers America.
- C. Magellan (5-77) circumnavigates the world (1-133),

The Reformation and Religious Wars

- I. CAUSES OF THE REFORMATION (6-376).
- A. Effect of the Renaissance (6-387). Social and political unrest in Germany; printing and translation of Bible into national languages.
- B. Forerunners of the Reformation: Wycliffe (7-505) and the Lollards; John Hung (4-211) attacks corruption of the Church in Bohemia; influence of Erasmus (8-295).
- II. POLITICAL AND SOCIAL CONDITIONS OF EUROPE.

A. Consolidation of Spain.

a. Marriage of Ferdinand and Isabella (4-301).

b. Moorish power broken (7-105).

c. Charles V rules the Holy Roman Empire and all Hapsburg possessions (4-129; f.-i.).

B. French Designs on Italy.

a. Battle of Ravenna (f.-i.; 6-368).

- b. Savonarola (6-500) preaches moral and religious revival.
- c. Invasions of Italy distract attention from religious revolt.
- III. REFORMATION BEGINS IN GERMANY.

 A. Germany was ready for the Reformation.

- B. Luther (5-53) and his teachings (6-376; 5-53).
- C. Peace of Augsburg (6-377) ends civil wars. Since this peace left to each ruler the right to establish either Lutheranism or Catholicism, many of the people who disagreed with their rulers were forced to emigrate.

IV. CALVINISM,

A. In Switzerland.

- a. Zwingli (7-528) preaches radical reform. In the disagreement between Zwingli and Luther lay the germ of much future Protestant dissension.
- b. Calvin (2 178) and his teachings.

B. Huguenots (4-201) in France.

- a. Persecutions and St. Bartholomew Massacre (6-400).
- b. Henry IV and Edict of Nantes (5 316).
- Richeliou (6-400) destroys political power of Huguenots.
- C. In Scotland. John Knox (4 423) founds Scottish Presbyterianism.

Note: For the Reformation in England, see 8-129.

Period of Civil Strife

- I. SPAIN AND THE REVOLT OF THE NETHER-LANDS.
- A. Catholic Policy of Philip II (6-155).
- B. Fight for independence of the United Provinces against Spain. William the Silent (7-454).
 Treaty of Westphalia (1-417; 5-380).

II. COUNTER-REFORMATION.

- A. Churchmen attempt to end abuses. Savonarola (6-500).
- B. Reform within the Catholic Church. Loyola (5-46) and the Jesuits; Francis Xavier (7-506).
 C. The Inquisition (4-268).

- III. THE THIRTY YEARS' WAR (7-269).
- A. Last Great Religious War spreads from German Empire into all Europe.
 - a. Gustavus Adolphus (f.·i.), the Protestant champion. Originates modern army (1-248).
 b. Richelieu (6-400) aids Protestant cause.
 By this time the religious significance of the war had been lost sight of.

B. Results of War.

a. Religious question settled in Germany. b. Terrific devastation of countries that had been fought over.

Note: For the Civil War, Commonwealth, and Restoration in England, see 8 130.

Struggle for Power and Possessions

- I. THE AGE OF LOUIS XIV IN FRANCE.
- A. Louis XIV, the Grand Monarque (5-42).
 - a. Inherits strong monarchy, built by Richelieu (6-400) and Mazarin (5-150). Absolutism illustrated by incident of the "Man in the Iron Mask" (4-296).
 - b. Persecution of the Huguenots (4-201).
 - c. Foreign policy—wars to extend French power. Louis systematically paid foreign court officials and even rulers to support his cause, bribing for instance James II, King of England.
- B. French Society during Reign of Louis XIV.
 - a. Court at Versailles.
 - Spectacular extravagance (5-42); art under royal patronage (3-439).
 - b. Golden age of French literature (3-453). Corneille (f.-i.); Molière (5-231); Racine (6-334); Voltaire (7-406).

- II. STRUGGLE TO MAINTAIN BALANCE OF POWER.
- A. What "Balance of Power" means. From the 15th century there appeared in European politics a new theory, that of the "Balance of Power"—the maintenance of an equal balance among the nations of Europe. Louis XIV threatened this balance of power.
- B. War of the Spanish Succession (7-105).
 - a. Marlborough, the great English general (5-131).
 - b. By the Treaty of Utrecht, 1713, Britain obtained Gibraltar, Newfoundland, Nova Scotia, etc.
- C. War of the Austrian Succession (1-326).
- D. Seven Years' War (7-2).
 - a. Preceded by diplomatic revolution. France and Austria against Prussia and Great

Britain; importance of Chatham (2-809); weak rule of Louis XV (5-48).

b. Overseas contest. In America (7-2); in India (2-411; 7-2).

c. Results of the war. Extension of British Empire at the expense of France; gains by Prussia. *

III. RACE FOR COLONIAL EMPIRES.

- A. Results of Discoveries. The discoveries of new lands in the western hemisphere led Spain, Portugal, the Dutch Republic, Britain, and France to soize areas in the New World. Claims to the new territories were based upon priority of discovery and settlement.
- B. Spanish America.
 - a. Columbus (2-467) establishes Spanish claim to New World. Explorations continued by Balboa (1-348); Ponce de Leon (f.-i.); Amerigo Vespucci (1-132).

- b. Spain's empire: In South America (7-98); West Indies; Central America (2-292); Mexico (2-513; 1-134; 5-188).
 - 1. Conquest of native peoples. Cortes (2-518) in Mexico; Pizarro (6-210) in Peru.
 - 2. Las Casas, Dominican monk, protector of the Indians (f.-i.).
- c. Spanish colonial policy was one of ruthless exploitation.
- C. Portugal obtains great colony of Brazil (2-49).
- D. French Explorers in North America. Cartier; Champlain; Marquette; Joliet; La Salle (all in f.-i.).
- E. Other Settlements in North America.

Dutch Colonies in New World (5-416, 421). Note: For British exploration and settlement, and colonial results of the Seven Years' War, see 8-131.

Rise of Prussia and Russia

- I. THE BEGINNINGS OF PRUSSIAN POWER.
- A. Early Duchy under the Hohenzollerns (f.-i.).

 Prussia had been converted to Christianity by the Teutonic Knights (f.-i.).
- B. Frederick the Great (3-462) raises Prussia to state of first rank.
 - a. Soizure of Silesia and Seven Years' War (7-2).
 - b. Partition of Poland (3-463).
- II. FORMATION OF THE RUSSIAN EMPIRE.
- A. Russia before Peter the Great.
 - a. Early leadership of Kiev (6-473).
 - b. Mongol invasion shuts off contact with Western Europe (6-474).
 - c. Grand Dukes of Muscovy reorganize Russia (6-474).
- B. Peter the Great (6-145). One man changes a medieval empire into a modern state (6-474; 4-479).
 - a. Defeat of Charles XII of Sweden (6-146).

- b. Baltic provinces annexed.
- C. Catherine II (6-474) continues Peter's policies.
 - a. Seven Years' War (7 2).
 - b. Shares in partition of Poland (3-463). Kosciusko, Polish patriot (6-210).
 - c. Ambitions along the Black Sea.
 - III. LESSER EUROPEAN STATES IN THE EIGHTEENTH CENTURY.
- A. Decline of Spanish Power.
- B. Italy without political unity. Bourhons (2-28) succeed Hapsburgs (4 129) in Naples and Sicily.
- C. Weakness of Austria. After the death of the Emperor Charles V, Austria was ruled by the Austrian branch of the Hapsburgs.
 - a. Conflict among the different peoples of the Austrian Empire.
 - b. Reign of Maria Theresa (5-125); loss of Silosia; Seven Years' War (7-2); partition of Poland (3-463).

The French Revolution and Napoleon

- 1. REVOLUTION IN FRANCE (3-466).
- A. Sources of the Revolutionary Movement.
 - a. Influence of Liberal thinkers. Voltaire (7-406); Rousseau (6-459); the Encyclopedists (8-245, 466).
 - b. Abuses of the old régime (8-451, 466).
 - c. Failure of reforms under Louis XVI (5-48). Influence of Marie Antoinette (5-125).
- B. Overthrow of the Old Régime.
 - a. Meeting of the States-General; Bastille stormed and social revolution (3-467); serfdom ended; royal family escorted to Paris.
 - b. Constitution drawn up. Declaration of the Rights of Man (8-468),
 - c. Leaders: Mirabeau (5-224); Lafayette (4-486); Talleyrand (7-220).

- d. Flight of king leads to abolition of monarchy. Execution of Louis XVI.
- C. Reign of Terror (3 469). Government by the Convention (3-451).
 - a. Dominated by Jacobins (4-334). Robespierre (6-414); Danton (3-47).
 - b. Control by terrorism. Execution of Lavoisier (4-457); Marie Antoinette; Jean Paul Marat (5-120; 3-469).
- D. Directory Established (8-452).
 - a. Wars with foreign powers. The hostility of France's neighbours to the revolutionary spirit had brought on a whole series of wars (3-452, 469).
 - b. Napoleon Bonaparte, the "man of the hour" (5-318).

Marriage to Josephine Beaubarnais (4-883); campaigns under the Directory; Egyptian campaign (5-318).

II. NAPOLEONIC ERA.

- A. Bonaparte overthrows the Directory and establishes the Consulate (8 469).
 - a. Wars against second coalition (5-318).
 - b. Peace of Amiens (1-139; 5 319).
- B. Napoleonic Empire.
 - a. Imperial conquests extended over most of Europe. Naval power crushed at Trafalgar (7 304).
 - b. Napoleon as statesman.
 - c. Effects of Continental System: in Europe (5-322): in United States it led to war with Britain in 1812.
- C. Napoleon's downfall through national risings and military reverses.
 - a. Peninsular War (6 116); retreat from Moscow (5 322, 321 illus.).
 - b. Hundred Days (/.-i.) and Waterloo (7 428).
 - c. Exile to St. Helena.
- III. CONGRESS OF VIENNA, 1814 15, AND PERIOD OF REACTION.
- A. Partition of Napoleonic Empire among European

- powers (8-315, 316 illus.). Work of Talleyrand (7 220) for France.
- B. Formation of Grand and Holy Alliances. The Quadruple (Grand) Alliance (f.-i.) was formed by Austria, Russia, Prussia, and Great Britain; the last subsequently withdrew, and France was included.
 - Note: In reconstructing Europe the Congress of Vienna was guided by dynastic rather than national claims. The representatives of the old aristocracy in seeking to restore the "balance of power" sowed the seeds of later conflicts.
- C. Age of Metternich. For thirty years after the Congress of Vienna, the moving spirit of European politics was Prince Metternich (1 326; 3 315; 4 314; f.-i.), the Austrian statesman. He was the consistent foo of democracy and set his face against any suggestions of change.
- D. Decline of Reactionary Power.
 - a. United States proclams Monroe doctrine (f.-i.).
 - b. Successful war of independence against Turkey in Greece (7–335).
 - c. Revolution of 1830 in France (3 453) over-throws Charles X (2 309).

The Industrial Revolution

I. OLD INDUSTRIAL CONDITIONS.

The Renaissance had had little effect on the every-day life of the people. Nearly all the work of the world was done by hand labour with a few simple tools; communication was slow and hazardous; the masses of the people continued to live in the same hard and confortless conditions as they had done from the earliest times right through the Middle Ages. Then, in about a generation, the adoption of a few practical inventions brought about the industrial revolution (4 259) and radically changed living conditions.

II. HOW THE CHANGE CAME ABOUT.

- A. Inventions in spinning and weaving.
 - a. Hargreaves (4 132) invents spinning jenny (1-239; 7-136). Improvements by Arkwright (1 239) and Crompton (2 533).
 - b. Cartwright (2 255) invents power loom.
 - c. Whitney's cotton gm adds impotus to textile industry (2 518).
- B. Invention of Steam-engine fills great industrial need; Watt, father of the steam-engine (7-431).
- C. Rise of the Factory System (2-353; 4-259).

- D. Improvement in Communications.
 - a. Building of Roads (6 404; 5 57) and Canals (2 204).
 - b. Application of steam-engine (7 152) to transport. Fulton (3 488) applies steam to navigation; locomotives (5 1) and railways (6 354); Stephenson's locomotive (7 155; 5 1 illus.).
 - c. Use of Electricity (3 210). First English telegraph line (6 341), submarine cables unite continents (2 152).
- E. Improvement of Agricultural Methods (1–78). Better ploughs, reaping machines; introduction of rotation of crops; increased care in breeding farm animals: changes improve supply of food.

III. SOME RESULTS OF THE INDUSTRIAL REVOLUTION.

- A. Factory System (4-260) supplants home industry.
- B. Large-scale Capitalism (f.-i.) develops.
- C. Trade Union (7-304) movement grows.
- D. Social Conscience develops, leading to legislation prescribing factory conditions, hours of labour for adults, restriction of child labour, etc

Europe in the Nineteenth Century

- I. DEMOCRACY AND REACTION IN FRANCE.
- A. Bourbon Restoration under Louis XVIII (5-43). Reactionary policies of Charles X (2-309) and the Revolution of 1830 (3-453).
- B. Louis Philippe, the Citizen King (5-44).
- C. Revolution of 1848 and Second Republic (3-453)
- D. Napoleon III and the Second Empire (5-323).
 a. Foreign policy: participates in Crimean War; aids Italy against Austria; interfores in Mexico.
- b. Domestic administration marked by prosperity and public improvements; Paris rebuilt.
- E. Franco-Prussian War (3 458) and the Third Republic.
 - a. Germany crushes France; siege of Metz (5-185); disaster at Sedan (3 459; 5-185).
 - b. Third Republic (3-453). Commune of Paris suppressed (3-453, 459).

- II. FOUNDING OF THE GERMAN EMPIRE.
- A. Revolution of 1848 seeks democratic and united government.
- B. Bismarck (1-474) builds Prussia's power. Schleswig-Holstein seized (8-74); Seven Weeks' War with Austria and formation of North German Confederation (f.-i.).
- C. Franco-Prussian War (3-458); Empire proclaimed.
 - a. Germany defeats France in short campaign. b. Germany united as a Hohenzollern empire—the First Reich (4-8).

III. FORMATION OF AUSTRIA-HUNGARY.

- A. Revolution of 1848 in Hapsburg lands.
 - a. Kossuth leads rising in Hungary (4 207). b. Insurrection in Italy led by Sardinia-Piedmont (4-316).
 - c. Revolt in Bohemia (1-326).
- B. Francis Joseph begins long reign (f.-i.).
 - a. Loss of Italian provinces.
 - b. Defeated by Prussia in Seven Weeks' War.
- C. Dual Monarchy formed (1-825).

IV. UNIFICATION OF ITALY (4-316).

- A. Mazzini (5-151) and the Republic of Rome.
- B. Victor Emmanuel II (4 316) and his great minister, Cavour (f.-i.).

- a. Garibaldi (3-504) and his "thousand redshirts."
- b. Pope Pius IX (6-210) opposes the new kingdom.

V. OTHER EUROPEAN COUNTRIES.

A. Scandinavia.

- a. Denmark. Loses Norway after Napoleonic Wars (5-465); Prussia and Austria seize Schleswig-Holstein (8-74).
- b. Sweden. Loses Finland (3-355); regains Norway (5-465).
- c. Norway becomes an independent kingdom (5-465).

B. Iberian Peninsula.

Spain loses most of colonial empire. Insurrections in Cuba (8-6) and war with United States (7-362).

- C. The Low Countries.
 - a. Kingdom of the Netherlands created, 1815 (1-417).
 - b. Revolt of southern Netherlands, 1830 (1-417).
 - c. Kingdom of Belgium recognized, 1839. Leopold II (4 484) secures Congo (1-418).

Note: For Great Britain in the 19th century, see 8-130.

Africa and Asia

- I. SCRAMBLE FOR TERRITORY IN AFRICA.
- A. Exploration discloses vast resources (1-54). Livingstone (4-526) and Stanley (7-144). Leopold II, king of the Belgians (4-484), starts the race to secure territory in Africa (1-55; 1-418; 2-481).
- B. Subsequent European acquisitions in Africa (1–55).

II. EUROPEANS IN CHINA.

- A. China opened to Foreigners through Treaty ports (2-373). Great Britain obtains Hong Kong (4-191) through Opium War (5-521).
- B. Exploitation by Foreign Powers.
 - a. Defeat by Japan leads to foreign intervention (1-272).
 - b. German holdings in Shantung (7-17).
 - c. Manchuria (5-112) falls under Russian, and later Japanese, influence.
 - d. "Open door" (f.-i.) agreement saves national integrity.
- C. Revolution of 1911 establishes republican government, 1912 (2-373).

III. RUSSIA TURNS TO THE EAST.

A. Reaction after the Crimean War (6-474).

- a. Alexander (6-474), the "Tsar liberator," frees the serfs.
- b. Return of repressive measures. Growth of Nihilist movement (6 474) Tolstoy (7-289) and his teaching.
- B. Advance in Asia.
 - a. March to the Pacific.

Trans-Siberian Railway links St. Petersburg (later renamed Leningrad) with the Pacific (6-472); influence extended through Manchuria (5-112; 6-474).

b. Central Asia.

Conquest of Turkestan; pressure on Indian border—Afghanistan (1-46) a buffer state.

IV. TRANSFORMATION OF JAPAN.

- A. Contact with the West.
 - a. Marco Polo's visit (4-344).
 - b. Matthew Perry's expedition (4-344; 1-272).
- B. Wars with China (4-349). Chinese attitude towards Japan (1-273).
- C. Russo-Japanese War (4-350; 6-474) makes Japan a world-power.
 - a. Annexation of Korea (4-425; 1-272; 4-340).
 - b. Japanese influence in Manchuria (5-112).

The Twentieth-Century World

I. EUROPE 1900-14.

A. Division of Great Powers (8-316).

- a. Triple Alliance between Germany, Austria, and Italy. A serious weakness of this alliance lay in the fact that Italy was linked with its ancient enemy Austria, which still held territories claimed by Italy (Italia Irredenta, "Unredeemed Italy"); Italy had joined the alliance from pique when France seized Tunis.
- b. Triple Entente of France, Russia, and Great Britain. Originally an alliance of Russia and France, it was enlarged to include Great Britain during the reign of Edward VII (3-169).
- B. Industrial growth makes Germany serious trade rival of Britain.
 - a. William II (7-458) backs economic ambitions with militarism.
 - b. African colonial possessions (1-55) developed.
 - c. Berlin-Baghdad Railway (1-346) started.
- C. Hague Peace Conterences, 1899 and 1907, attempt to combat militarism.
- D. Revolution in Portugal (6-269).
- E. Turkey loses most of its European territory.
 - a. Austria annexes Bosnia and Herzegovina (2-20).
 - b. Balkan Wars (3-315): territorial gains of Greece (4-78); Serbia (6-532); Montenegro (5-250); Rumania (6-470).

II. THE FIRST WORLD WAR.

A. Causes.

- a. The Spirit of Aggression. The fundamental cause of the catastrophe was the aggressive nationalism which had been steadily growing in the great European states. International relations were essentially competitive. In the half-century of diplomacy before 1914 national ambitions found an outlet in imperialistic colonial enterprises and a military rivalry that turned Europe into an armed camp, despite the opening in 1913 of the Palace of Peace at The Hague (4-116).
- b. The Spark that started the Blaze. The immediate cause was the crisis due to the assassination of the Archduke Francis Ferdinand (1863–1914), heir to the Austrian throne (1-326; 6-523).

For the military operations by land, sea, and air, and the general course of the War, reference should be made to the article on the First World War (7-478), to those on the various countries concerned, and to the chronologies and list of battles in the Fact-Index under World Wars.

B. Peace Conference at Versailles (7-484).

a. Representatives from all Allied and associated powers, but it was dominated by

- "big four:" Lloyd George of Britain (4-531); Clomenceau of France; Woodrow Wilson of the U.S.A. (7-455); Orlando of Italy (f.·i.).
- b. Other influential delegates: Borden of Canada (f.-i.); Smuts of South Africa (7-72); Venizelos of Greece (4-78).
- c. Treaty of Versailles with Germany. Subsidiary treaties with Austria, Hungary, Bulgaria, Turkey (Sèvres, Lausanne, 7-484).
- d. League of Nations (4-463) established.

III. RUSSIAN REVOLUTION.

- A. How the Revolution was accomplished (6 474).
- B. Abdication of Nicholas II (5-431; 3-317).
- C. Bolshevist Leadors: Lenin (4-478); Trotsky (7-318).
- D. Disruption of the Empire. Loss of Finland (8-355); Estonia (6-477); Latvia (6 478);
 Lithuania (6-478); Russian Poland; parts of White Russia and of the Ukraine (6 240);
 Bessarabia (6-478).

IV. YEARS BETWEEN FIRST AND SECOND WORLD WARS.

A. Germany.

- a. The Weimar Republic, led by Stresemann (4 9).
- b. Rise of Hitler (4 181) and Nazi (National Socialist) Revolution (4 10; 5 328).
- c. Re-militarisation of Rhmeland (4 10).
- d. Occupation of Austria (1-324; 4 10).
- e. Munich Crisis and Agreement (8 24;
- 4 10; 4-184 5-296; 7-486).
- f. Occupation of Czechoslovakia (3-24; 4 10).
- g. Seizure of Momel (3-318; 7-486) and Danzig (3-49).

B. Empire of Austria-Hungary dissolved (1 326).

- a. The "succession states": Austria (1-322); Hungary (4-205); Czechoslovakia (3-21).
- b. Borderlands lost: South Tirol (Trentino-Alto Adige) to Italy (7-280); Austrian Poland to Poland (6-240); Bosnia, Herzegovina, Dalinatia, Croatia, Slovenia to the kingdom of the Serbs, Croats, and Slovenes (later called Yugoslavia) (1-326; 7-519); Transylvania and Bukovina to Rumania (6-470).
- c. Austria and Czechoslovakia occupied by Germans (4-10; 1-324; 3-24).

C. Italy.

- a. Rise of Mussolini (5-310) and Fascist Revolution (3-341; 4-316).
- b. Conquest of Abyssinia (1-7; 4-317).
- c. Rome-Berlin Axis formed (7-485; 5-311).

D. Spain.

a. Alfonso XIII (1-102) expelled (7-110) and republic proclaimed.

- b. Civil War (7-110); Franco (3 457; 2 28) becomes dictator.
- E. Turkey, under Mustafa Kemal Pasha (later Atatürk, father of the Turks) (4 396) becomes a westernised republic.

F. Russia.

- a. Civil war between "reds" (Bolsheviks) and "whites" (Tsarists) (6 476).
- b. Russia cut off from West by political differences.
- c. Stalin (7-141) succeeds Lemm; five year plans (6-476).
- d. Non-aggression pact between Germany and Russia (4-183; 6 476).

G. The United States of America.

- a. Congress fails to ratify Trenty of Versailles (7-362) and the U.S.A. remains outside the League of Nations. Concludes a separate peace with Germany in 1921.
- b. "Slump" of 1929 32 (7-362).
- c. President F. D. Roosevelt (6 449) and the New Doal (7 362, 363).

H. Japan renews attack on China.

- a. Occupies Manchura (1 272; 4 350). Sets up puppet state of Manchukuo (5 112).
- b. Invades China proper without declaring war (4-350).
- I. League of Nations (4 463) proves impotent against aggression, failing to prevent:
 - a. Jupan's aggression against Manchura (4 350; 5-112).
 - b. Hitler's re-occupation of the Rhineland.
 - c. Mussolini's attack on, and conquest of. Abyssinia (1-7; 4 317).

V. THE SECOND WORLD WAR, 1939 45.

A. Causes.

With Russia under Stalin (7–141) isolated to the east, Spain under Franco (3–457) to the southwest, and the United States too much concerned with its own problems of recovery from the desperate economic setback of the slump of 1929-32 (7-362), the United Kingdom and Franco found themselves faced with aggressive dictators in Germany (Hitler: 4–181) and Ita'y (Mussolini: 5-310). Germany, admitted to the League of Nations in 1926, withdrew from it in 1934 (4-10); Italy, an originating member, treated with contempt the half-hearted attempt made by the League to impose "economic sanctions" (that is, prevent Italy from obtaining certain valuable imports) in an effort to hinder the Italian attack on Abyssinia (1-7).

Convinced that France and the United Kingdom would never take up arms to resist their aggressions, the two dictators became steadily bolder (see p. 127, under Germany and Italy). After Hitler annexed Memel (3-318) in March 1939, Britain entered into a pact of mutual assistance

- with Poland, and France declared that it would stand by the France-Polish treaty of 1925 if Poland were attacked. But, drunk with success, certain that neither France nor the United Kingdom would keep its pledge, Hitler sent his forces across the Polish frontier on September 1, 1939. The United Kingdom and France declared war against Germany on September 3.
- B. For the general course of the war, see the article on the Second World War (7 486). Refer also to the articles on the countries involved, commanders, battles, and places that figured in the fighting. The Fact-Index contains chronologies and a list of battles under the entry World Wars.

VI. AFTER THE SECOND WORLD WAR.

- A. Occupation of Germany (4-11) and of Austria (1-324) by the United Kingdom, the United States, France, and Russia; W. Germany and Austria regain their sovereignty in 1955, Austria as a neutral state.
- B. United Nations (7 354) imaggrated in London, 1946
- C. Peace treaties concluded, 1947, between the Allies and Finland; Bulgaria (2 121); Hungary (4 208); Italy; Rumanna (6 471). (See also Japan in page 129.)
- D. Soviet Russia emerges from Second World War embracing all lands of the Tsarist Empire (except part of Finland) plus the northern half of East Prussia (6 472; 4 4); Poland has new frontiers (map, 6 239).
- E. Communist governments seize power in Albama
 (1 92); Bulgaria (2 121); Czechoslovakia (3 24); Hungary (4 205); Poland (6 241).
 Rumania (6 471); Yugoslavia (7 520).
- F. Fourth Republic established in France.
- G. Tension between Communist Russia and its western Allies (6 477).
 - a. "Marshall Aid" (5 137; 7 363) accepted from the U.S.A. by countries of Western Europo; refused by countries of Eastern Europo.
 - b. Treaty of Brussels, 1948, between Britain. France, Belgium, the Netherlands, and Luxemburg, beginning of Western Union (f.-i.).
 - c. North Atlantic Treaty, 1949, signed by Brussels Treaty powers, the United States. Canada, Norway, Denmark, Iceland, Portugal and Italy; North Atlantic Treaty Organization (5-457; 3-319; 7-354, 364, 498) established; Greece, Turkey, W. Germany admitted.
- H. Tension in the Near East.
 - a. Jewish state of Israel $(4 \cdot 302)$ set up; hostility of Arabs $(1 \ 193)$.
 - b. Egypt: anti-British feeling (3–180); revolution (3–181, 182) and proclamation of republic.
 - c. Persia nationalises oil; agrees to international consortium 1954 (6-132).

- Japan occupied by the Allied (chiefly American) forces (4-350); peace treaty, 1951.
 - a. South Sakhalin and the Kuriles occupied by Russia.
 - b. Ryukyu and Bonin Islands, and former Japanese mandated territories in the Pacific, occupied by United States.
- J. Communists gain control of China (2-375); Nationalist government takes refuge in Formosa (2-333, 375; 3 424).
- K. Korea (4 425) freed from Japan and occupied by Allies.
 - a. North, occupied by Russians, adopts Communist government; South, occupied by other

- Allied (chiefly American) forces, adopts western form of government.
- b. After Allied withdrawal, North Koreans invade South Korea (4-426).
- c. United Nations support South Korea, leading to fighting, 1950-53 (4 426; 1 244; 7 354, 363).
- L. Independence secured in Far East by:
 - a. British India: wee India (4-254) and Pakistan (4 254; 6 39).
 - b. Ceylon (2 297).
 - c. Burma (2-130).
 - d. Indonesia (4 257).
- M. Struggle in French Indo-China against Communist Vietnmih forces (7-400).

BRITISH HISTORY

- I. TO THE END OF THE MIDDLE AGES.
- A. Early History.
 - a. Roman Britain (2 73; 8 275).
 - b. Anglo-Saxon invasions (3 276); Christianity returns (3 276); Alfred, the first great English king (1-103); Danish invasions (3 166; 3 276); Canara 2 215) rules all England; Saxon line restored in person of Edward the Confessor (3-166).
- B. Norman Conquest.
 - a. Normans under William the Conqueror defeat Harold at Hestings; death of Harold (3 276; 4-133).
 - b. Norman rule established (3–276). Feudalism
 (3–348) reaches height under Stephen (7–154).
 - c. Results of conquest. While the Norman Conquest brought Continental influences to England, in the end the Normans became Anglicised (5–449).
- C. Growth of Constitutional Government.
 - a. Beginning of systematic government under Henry II (4 161).
 - 1. Attempt to regulate the clergy fails (1 401); jury trials extended (4 162).
 - 2. Administrative reform continued by Richard I (6-398).
 - b. Magna Carta (5-80), the Great Charter that, made the king amenable to the law, exterted from John (4 378) by rebellious barons.
 - ·c. Growth of parliamentary power. Simon de Montfort (5 252) calls the First Parliament (6-86); result of Barons' war against Henry III (4 162); Model Parliament (6-86: 3-167); Edward I (3-166) encourages idea of law and order; Parliament divided into two houses (6-86; 3-167); Parliament under Edward II (3-167) begins to restrict the power of the king; quarrels with Richard II (6-399).
- D. England reaches out for more territory.
 - a. Edward I attempts to unite Scotland and England (6-512). Resisted by Wallace (7-415) and Bruce (2-96), Scottish heroes.

- b. Conquest of Wales (7 413).
- c. Loss of Normandy (5–449) under John left Aquitame (f, -i,) chief English possession in France.
- Black Death (1 478) causes decline of serfdom; Pensants' Revolt (7 339, 505).

Birth of a National Spirit.

- a. Effect of the Hundred Years' War (4 203). This struggle was carried on by armies recruited to serve the "national interest," not by personal retainers to further the design of their feudal lord.
- b. Beginnings of a national literature (3 284). Chaucer (2 311); Wychife (7 505) produces an English Bible; John Gower (f.-i.); William Langland (f.-i.).
- Wars of the Roses (6 453). Resulted in establishing powerful Tudor (7 323) line, first of whom was Henry VII (4 163).

II. REFORMATION IN ENGLAND.

- Wish of Henry VIII (4-163) for a divorce leads to break with Rome (2 381).
 - a. Opposition of Sir Thomas More (5 262).
- b. Underlying issues: The changes under Henry VIII had to do with Papal control rather than religious reform; Protestant doctrines had little influence before Edward VI (3 167).
- Catholic Reaction under Quoen Mary I (5-140). Tragedy of Lady Jane Grey (4-97).
- C. Elizabeth I (3 230) secures England's position as Protestant langdom.
 - a. Mary Queen of Scots (5 141) centre of Catholic movement.
 - b. Defeat of Spanish Armada (1-240) marks the beginning of British sea-power.
 - c. Elizabethan Age in literature (3-284), Shakespeare (7-12); Francis Bacon (1-340); Ben Jonson (4-382); etc.

III. QUARRELS BETWEEN STUART KINGS AND PARLIAMENT.

- A. James I (4-338) attempts to rule by "Divine Right."
- B. Charles 1 (2-306) continues the policy. John
 Hampden (4-123) leads resistance to ship money.
 Long Parliament (2 307; 8 278) begins.
- C. Failure to settle Religious Question.
 - a. Gunpowder Plot (8 343; 4 339) to blow up Parliament.
 - b. Persecution of Puritans (6 311) and "great migration."
 - c. Bishops' wars in Scotland (6 512).

IV. CIVIL WAR, COMMONWEALTH, AND PROTECTORATE.

- A. Parliament leads War against King (2 306; 8-278). Scotland and Parliament (6 512).
- B. Cromwell (2 583) in Power.
 - a. King Charles is put to death (3 278).
 - b. Irish rebellion crushed (4 282); the "levellers" (2 534).
- C. Age of Puritan and Cavalier in literature.
 - a. Influence of King James's Bible (1-443.)
 - b. Great Puritan writers (3 286, 287) · Milton
 - (5-209); Bunyan (2 125).

V. THE RESTORATION.

- A. Charles II (2-307) seeks absolute power.
 - a. Habeas Corpus Act (4-115) passed.
 - b. Growth of sea-power in war with the Dutch Republic (2-308).
- B. James II (4.339) attempts to secure Catholic restoration.
- C. The Glorious Revolution of 1688 (5-132; 3-280).

VI. CONSTITUTIONAL MONARCHY ESTABLISHED.

- A. William III (7 452) and Mary II (5 140) reestablish Protestant rule. Bill of Rights (1 446) fixes supremacy of Parliament. Toleration Act begins peaceful adjustment of religious rights.
 - a. Union of Scotland and England (8 281; 6-513).
 - b. Age of Queen Anne (1 158). Marlborough (5 181) and the War of the Spanish Succession
 - (8-281); period of intellectual activity; rise of newspapers and periodicals (5 403); Dryden (8-129); Pope (6-258); Swift (7-204)
- B. Limitation of King's power under early Hanoverians.
 - a. Growth of Cabinet government (2-151; 4-50). Work of William Pitt the elder (Lord Chatham) (2-309).
 - b. Whigs strengthen position of House of Commons.
- C. Reaction under George III (8-521).

Sir Isaac Newton (5 408).

- a. Dismissal of Chatham and close of Seven Years' War (7-2).
- b. Failure of Tory colonial policy (7-861); Burke (2-129) the champion of Whig policies towards America.

- D. Wars with Revolutionary France and Napoleon (8-452, 469; 5-318.)
 - a. Work of William Pitt the younger (6-208).
 - b. Nelson (5-363) socures British supremacy
 - c. Wellington (7-436) and the battle of Waterloo (7 428).
- E. War of 1812 with United States (7-361).

VII. GREAT BRITAIN IN THE NINETEENTH CENTURY.

- A. Beginnings of Political and Social Reforms.
 - a. Industrial Revolution brings demand for more democratic government and remedy of social abuses (4 259).
 - b. Catholic Emancipation (6-105). The laws prohibiting "Dissenters" from holding office had already been repealed; in 1858 political privileges were extended to the Jews.
 - c. Reform Act of 1832 (6 88; 7-407, 453) transfers political power to middle classes.
 - d. Repeal of Corn Laws (3 12; 6-105), and establishing of Free Trade.
- B. Victorian Age.
 - a. Influence of Queen Victoria (7-395).
 - b. Crimean War (2 532) and western support of Turkey.
 - c. Neutrality in American Civil War (f.-i.) Arbitration on Alabama claims.
 - d. Social Changes: Suffrago extended in 1867 and 1884; secret voting adopted (1-356). Employers' Liability Act, 1880; Trades Union Congress founded (7-304). Elementary education made compulsory (4-26); admission to universities allowed without religious test." (4-26).
 - e. The Irish problem (4–283). Gladstone (4–26) attempts to solve it; work of Parnell (6–91)

VIII. GREAT BRITAIN IN THE TWENTIETH CENTURY.

- A. Edward VII (3-169).
 - a. Edward the Peacemaker's exceptional knowledge of the men and movements of his time was of the greatest service in British foreign policy; Entente with France ("Entente Cordiale," f.-i.).
 - b. Old Age Pensions introduced (6-120).
- B. George V (3 522).
 - a. First World War (7-478).
 - b. Name of Royal House changed to Windsor (3-522).
 - c. The between Crown and Dominions strengthened (2-84).
 - d. Statute of Westminster (2-84) defines equality of status of self-governing Dominions with mother country.
 - e. Irish Free State created (4-283).
 - f. National Health and Unemployment Insurance $(f, \cdot i.)$ introduced; House of Lords' veto restricted (6-88); women given the vote (7-407).

- C. Edward VIII (8-169). Abdication.
- D. George VI (8-522).
 - a. New Constitution in Irish Free State (Eire) (4-283); Eire severs last link with U.K. in the Republic of Ireland Act, 1949 (4-284).
 - b. Second World War (7-486).
 - c. India (4-254), Pakistan (4-254), and Ceylon (2 297) granted dominion status, India later becoming a republic. Burma (2-130) becomes independent republic.
- d. Fighting in Malaya (5-97); Kenya (4-400); Korea (4-426).
- e. National Health Service (f.-i.); Labour govt. introduces nationalisation of coal, electricity and gas, transport, civil aviation. All plural voting abolished (7-407); House of Lords' veto further restricted (6-88).
- E. Elizabeth II (8 233).

Coronation (2-509, 511 illus.; 8-235 illus.); Commonwealth tour (8-234).

The British Commonwealth

Great Britain acquired a world-wide empire more or less by accident. There was never any concerted government policy to go out and seize territory in the lands that began to come within European knowledge from the 15th century onward. Venturesome seamen and explorers, hardy settlers, energetic traders carried the British flag to the Americas, to Asia, to Australia, to the Pacific, and were followed by troops and officials eent out, often grudgingly, by the home government. In the 18th century Britain lost one empire -now the United States-through the stupidity of the government in London; during the 19th and 20th centuries a new British Empire was consolidated by the granting of ever increasing selfgovernment to the separate peoples within it.

A. British Exploration and Settlement.

a. Early voyages the basis of English claims. John Cabot (2-156); Drake (8-113); Hudson (**4 199**; **6**–242; **1**–136).

b. Early colonising enterprises. Raleigh (6-362) founds a colony; founding of the Thirteen Colonies (7 361; 2-82); Hudson's Bay Company (4 200).

- B. Colonial Results of the Seven Years' War (7-2) between England and France.
 - a. In America. French lose Canada.
 - b. In the East. British control established in India. Work of Clive (2 411); continued by Warren Hastings (4-136).

C. British Empire in Africa.

- a. Occupation of Egypt (3-176). Share in control of Suez Canal (3-176; 7-181); conquest of Anglo-Egyptian Sudan (3-178); "Chinese" Gordon (4-47) and Kitchener
- .b. Control of South Africa. Boer War (1-502); work of Cecil Rhodes (6-393).
- D. Growth of the Empire.
 - a. Disraeli (8-93) lays foundation of modern British imperialism. Half-share in control of Seez Canal (7-181).
 - b. Indian Mutiny (4-252). Victoria crowned Empress of India.
- E. Trusteeship Territories. Former German colonies in Africa and the Pacific mandated by League of Nations to Britain, Australia, and New Zealand after First World War; placed under United Nations Trusteeship after Second World War.

I. CANADA.

A. Exploration and Early Settlement.

a. First Explorers (1-136). John Cabot (2-156); Cartier (f.-i.); Henry Hudson (4-199). b. Beginnings of settlement. First French settlement at Nova Scotia; Champlain founds Quebec (6 321); founding of Montreal (5-255). c. Extension into interior. Marquette and Joliet (f.-i.); La Salle (f.-i.).

B. Conflict of French and British.

a. British claims to Canada. Nova Scotia (5-469) and Newfoundland (5 394). Hudson Bay (4 200) region.

b. Hudson's Bay Company, a rival to French

fur-trading interests (4 200; 3 496).

c. Seven Years' War (7-2) ends French rule in Canada. Deportation of Academs (5-470). Wolfe (7-465) and Montcalm (5-249) at Quebec.

C. A Century of British Rule.

a. Development of Self-Government. Rebellion of 1837. Papineau leads French in Lower Canada (6 321); Mackenzio in Upper Canada; union of Upper and Lower Canada with a responsible government: the Act of Union was passed by the British Parliament upon the recommendations of Lord Durham, whose report upon British North America became the basis of Britain's system of imperial government.

b. Westward Expansion. Mackenzie (f.-i.) organizes North-West; Hudson's Bay Company and the fur trade (3-496); early coloni-

sation of Manitoba (5-114; 7-461).

D. Under Dominion Government.

a. Territorial Expansion. Purchase of territory of Hudson's Bay Company. Organization of Manitoba precipitates Red River Rebellion (5-115). British Columbia (2-80) joins federation. Canadian Pacific Railway (6-358, 359 illus.) opens western prairies to settlement. Yukon organized (7-520).

b. Imperial Relations. - Participates in the Boer War (1-502); in the World Wars (7-481,

486, 494-6, 497 illus., 499 illus.).

II. AUSTRALIA.

- A. Early Visitors.
 - a. Luis de Torres and Tasman (1-317).
 - b. Dampier (3-36; 1-317).

- D. Captain Cook (2 494). Cook the "real discoverer" of Australia (1-317).
- C. Exploration of Interior. E. J. Eyre (f.-i.; 6 322).
- D. Early Settlement.
 - a. New South Wales (5-402) founded.
 - b. Discovery of gold (1-318; 4-39).
 - c. Penal settlements (1-318).
- E. Federal Constitution adopted (1-318).
- F. Australia participates in World Wars (7 480, 486, 489, 490, 493, 494).

III. NEW ZEALAND (5 422).

- A. Discovery and Exploration.
 - a. Tasman (1-317; 5 425).
 - b. Captain Cook (2 494).
- B. First Settlements.
 - a. Place of call for whalers (5 425).
 - b. Missionary founds a colony (5 425).
 - c. Wars with, and eventual acceptance of, the Maoris (5 425; 5 79 illus.; 7 230 illus.).
- C. New Zealand participates in World Wars (7-180, 486, 489).

IV. AFRICA.

- A. South Africa.
 - a. Early European visitors: Diaz (1 53; 2 215; 7 89); Vasco da Gama (7 382).
 - b. Beginnings of settlement: Dutch East India Company founds plantation near Table Mountain (1 51; 2 84); pioneers trek into interior; Cape Colony (2 84) becomes British.
 - c. The Great Trek (1-51). Boors set up independent republies beyond the Vaal and Orange rivers; Battle of Majuba Hill (1-502).

- d. Opening up the Country. Discovery of diamonds (1-52; 7-91) and of gold (1-50: 7-88); influence of Cecil Rhodes (6-393; 7-91).
- e. South African War of 1899-1902 (1-502).
 - 1. Jameson Raid (1 502; 7-92).
 - 2. Siege of Ladysmith (f.-i.; 1-502, 503) illus.) and Mafeking (f.-i.).
 - 8. Leaders. British: Lord Roberts (6-414); Lord Kitchener (4-415). Boor: Botha (7-72, 92); De Wet (f.-i.); Cronje (f.-i.); Joubert (f.-i.); Smuts (7-72).
- f. Union of South Africa.
 - 1. Formation (7 92).
 - 2. Conquest of South-West Africa (7 89).
- g. South Africa participates in World Wars (7 486, 496).
- B. British West Africa (2 84).
- C. British East Africa (2 84).
- D. Rhodesia and Nyasaland (6 394; 1-55; 2-84).

V. ASIA.

- A. British East India Company (f.-i.).
 - a. In India.
 - b. In Malaya.
- B. Acquisition of Ceylon (2 297).
- C. Conquest of Burma (2-130); independence granted.
- D. India, Pakistan, Ceylon gain Dominion status, India becomes a republic within the Commonwealth.
- E. Malaya formed into a federation (5 93).
- F. Singapore (7-56).

UNITED STATES OF AMERICA

I. BIRTH OF A NATION.

- A. Independence.
 - a. Independence declared (7-361); George Washington (7-420); Benjamin Franklin (3-460).
 - b. Government under the Articles of Confederation, drawing-up of the Constitution (7-361).
- B. The Early Years.
 - a. Triumph of the Democratic Republican Party. Louisiana Purchase (4.358; 5-222; 7-361) opens up vast possibilities of expansion. War with Britain, 1812-14 (7-361).
 - b. Era of Good Feeling:
 - 1. Expansion of territory: Florida (3-393) purchased (7-361).
 - 2. Monroe Doctrine (f.-i.) formulated—the basis of American foreign policy (7-362).
 - c. Administration of John Quincy Adams (f.-i.). Beginnings of Whig and Democrat Parties.
- C. The Civil War.
 - a. Rise of the Movement for the Abolition of Slavery (7-66).
 - b. Election of Lincoln (4-511) to Presidency: the Civil War (see American Civil War in f.-i.).
 c. Reconstruction.

- II. FOREIGN POLICY AND GROWTH OF A COLONIAL EMPIRE.
- A. Fishery Disputes.

Disputes over Newfoundland fisheries and Bering Sea seal fisheries settled.

- B. Beginning of Pacific Island Interests.
 - a. United States shares in division of the Samoan Islands (6 494).
 - b. Annexation of Hawau (4 139).
- ·C. Development of the Monroe Doctrine.
 - a. France forced to withdraw from Mexico (5 186).
 - b. Arbitration in British-Venezuelan boundary dispute.
 - c. Hostility of South America softened by Pan-American movement (7-101) Monroe Doctrine recognized by League of Nations.
- D. Spanish-American War (7-362).
- E. Panama Canal (6-53).
- F. American Contributions to International Peace.
 a. Policy of international arbitration.
 - b. Stands aside from the League of Nations (4-463; 7-362, 456).
 - c. An originating member of the United Nations (7-354).

- G. U.S.A. and the World Wars (7-362, 363, 482, 491).
- III. INTERNAL AFFAIRS IN THE TWENTIETH CENTURY.
- A. Theodore Roosevelt inaugurates an era of reform; combats trusts.
- B. Woodrow Wilson (7-455) fails to bring the U.S.A. into the League of Nations.
- C. The Prohibition Era (1 96; 2 335).
- D. F. D. Roosevelt (6-449) and the "New Deal."
- E. President Truman (7-321) and President Eisenhower (3-206) in office (7-363).

The States of Latin America

A. SOUTH AMERICA.

South America was discovered by Columbus (2-467) and for 300 years was ruled partly by Spam, partly by Portugal, which held Brazil. Latin America now comprises ten republics; British and French Guiana, and Surinam (Dutch Guana). The Instory of each country is given in the respective articles: Argentina (1 223); Bolivia (1 507); Brazil (2 45); Chile (2 357); Colombia (2 457); Ecuador (3-160); Paraguay (6 76); Peru (6-138); Uruguay (7-370); Venezuela (7 384); Guiana (4-101).

See also the articles on Pizarro, Spanish conqueror of Peru (6-210), and the Incas (4 237), rulers of Peru before the Spaniards arrived.

B. CENTRAL AMERICA.

Discovered by Columbus (2-467), conquered by Spain (Cortes, 2 513); now consists of six republics, together with British Honduras. For particulars of their history see Guatemala (4 101); Salvador (6-492); Nicaragua (5 430); Honduras (4-190); Costa Rica (2-514); Panama (6-52); British Honduras (4-189).

C. MEXICO (5 186).

See also the article on the Aztecs (1 331), and references in the Fact-Index to the Maya and Toltec peoples.

NOTE: For History Charts, showing what was happening at the same time in different parts of the world, see pages 134-146.

Interest-Questions in History

How is it known that 10,000 years ago some European lakes were inhabited by men? 5 109.

How did a pick and shovel make a myth come true? 7-319.

Why was India not conquered by Alexander the Great? 1-90.

How did Alfred the Great defeat the Danes? 1 103.

Who is thought to have discovered America 500 years before Columbus? 1 132

How did science keep the Romans out of Syracuse for three years?

How did Aristides help to banish himself? 1-227.

What great philosopher through one pupil sent the culture of his country throughout the civilized world? 1-223.

Hew did Sir Francis Drake "singe the Spanish king's beard"?

What great king was overthrown by Cortes in the New World? 2 51'3
What European king personally owned an African state? 2 481.
What great English essayist, philosopher, and statesman was
convicted of receiving bribes? 1-310.

Why did the Portuguese give Bombay to England? 1 515.

What explorer received ten pounds for discoveries in the New World? 2–156.

How did English become the dominant language in Canada? 2 200 Why did a king of England order the sea to flow back? 2 215. What early Frank put down anarchy? 2-305

Why did the old Venetian rulers throw a wedding ring into the sea every year? 1-20.

What king awed his throne to a girl general? 4-376.

What early government always had two kings at the same time?

How can stones tell the progress of Man? 7-164.

How did a thistle save the Scots from Norse invaders? 7 270.

How did being blind in one eye help a famous English naval officer to victory? 5-363.

What great explorer was killed by the natives of Hawaii? 2-405.

What famous early explorer was east adrift by his men to perish in the Arctic? 4-200.

How was Greek influence brought to India? 1-99; 4-251.

How did a king and queen give to Europe a new nation and to the world a new continent? 4-301,

Who were the first merchants to come to England for tin? 3-275.

What statesman escaped from his beleaguered capital by balloon?
3 450.

How did a single monk stop the gladiatorial contests of ancient Rome? 4 26.

What English queen reigned only nine days and died on the scaffold? 4 97.

What beautiful queen conquered two great warriors with her charms but failed with the third? 2 107.

What foreign minister of France was able to keep his position through the Directory, the Napoleonic empire, and the restored Bourbon monarchy? 7 220.

Who was the earliest European to describe the city of Hangchow, China? 4 '26.

How did the Northmen finally conquer the English from the south instead of the north? 4-133.

How did throwing a king's representative out of a window involve Europe in 30 years of war? 7-269 illus.

What Tsar worked in a shipyard? 6-116

What Spaniard accepted a ransom of gold and silver to the value of £3,000,000 for a great Indian chief, and then killed him? 6-211.

What early European served Kublai Khan? 6-255.

What great Mahomedan leader is remembered because of his courtesy and kindness of heart? 6 158

When was Florence a city of Puritans? 6 500.

What did the scallop shell worn as a badge by pilgrims in the Middle Ages signify ? 6-502.

What Scottish queen was forced to abdicate in favour of her infant son? 5 142.

Who were the first Europeans to visit Japan? 4 344.

When did "tanks " first go into action? 7-223.

Which was the first Christian nation to abolish the slave trade?

What was the date of the first Labour Government in Britain? 4 427.

Who was first President of Turkey? 4-396.

When was the Zulu power broken? 7-527.

When did "bobbles" wear top-hats? 6-105 illus.

When was the present Vatican State constituted ? 7-382.

HISTORY SHOWN IN CHARTS

THE following charts have been drawn up to show at a glance the events occurring in different parts of the world at the same time. It should be noted that they are drawn up according to the Christian calendar, which dates events as so many years before the birth of Christ (8.C., meaning before Christ) or after it (a D, anno Domini, meaning in the year of the Lord) The people who lived before Christ did not, of course, think of them selves as living in, for example, 1000 a C, they had other

ways of reckoning chronology, differing in different parts of the world. The Christian calendar, moreover, did not come into use until the 6th century a D. long after Christianity had become the accepted religion of the Roman Empire; and is to day only the chief of several calendars in use Mahomedans, for instance, count a.D. 622, when Mahomet fled from Micca to Medina, as their year 1. Nearly all dates before the first millennium B C are approximate, although scholars are increasing their accuracy.

ANCIENT HISTORY

HOUSEHOLD SCIENCE

HOUSEHOLD science deals with the natural, economic, and social foundations of home life. The four main topics which it troats are shelter, food, clothing, home management. In this Outline there are gathered together references to the chief articles and portions of articles that will help anyone interested in the art of homemaking.

I. THE HOME AND ITS EQUIPMENT.

- A. Heating (4-149). Importance of keeping the house at the proper temperature; different heating systems; use of fans to keep the air fresh (3-340). Coal (2-426).
- B. Lamps and Lighting (4-442).
 - a. Electric lighting (8 217).
 - **b.** Gas lighting (3 505).
 - c. Gas and electric meters (5-183).
 - d. Matches (5 146).
- C. Locks and Keys (4 534).
- D. Furnishings and Decoration.
 - a. Wall coverings: wallpaper; paint (6-37); distemper (6 38); tapestry (7 224).
 - b. Floor coverings: carpets and woven rugs (2 246); linoleum (4 516); matting; fur rugs.
 - c. Furniture (3 490).
 - d. Baskets (1 378).
 - e. Pottery and Percelain (6 274).
 - f. Labour-saving Devices: vacuum-cleaner; washing machine; electric or gas heated iron; washing-up machine: time switches; etc.

II. SANITATION, VENTILATION, AND HYGIENE.

- A. Keeping the Home in Sanitary Condition: House-cleaning; care of food; keeping the drinking water pure and the air fresh. Laundry and dry cleaning (4 454).
 - a. Insect pests: flea (3 388); house-fly (8-401; 4 264); etc.
 - b. Mice (5 288) and rate (6-365).
 - c. Mildews and moulds (5 283).
- B. Hygiene (4 228) and health.
- C. First Aid (3 365; 6 238)
- D. Fire Fighting (3 361) and prevention.

III. FOOD.

- A. Diet (3-90, 409); meals (5-151).
 - a. Carbohydrates (3 409); starch (7-149); sugars and their food value (7 183).
 - . b. Fats (5-506; 3-410, 411).
 - c. Proteins (6 297; 3-409, 410).
 - d. Mineral salts (8-409; 5 505).
 - e. Vitamins (7-403).
- B Some Important Foods (8-408).

 - a. Meat (5-153).
 b. Food Fishes (8-877): Cod (2-442); hadherring (4-171): salmon doch (4-115); (6-489); skate (7-58); etc.
 - c. Eggs used as Food (8-172; 6-297).
 - d. Milk (5-205) and its products; dairy farming (3-25); cheese (2 313); butter (2-134).
 - e. Grain Foods: Flour (8-393); wheat (7-447); barley (1-368); rice (6-396); oats and uatmeal (5-490); etc.
 - f. Legumes or "pod" foods: beans (1-390); peas (6-99); lentils (4-482).

- g. Root, Bulb, and Tuber Foods: radishes and turnips (2-151); beets (1 410); carrots: onions (5 511); potatoes (6 273); parsnips (6 93): etc.
- h. Leaf and Stalk Foods: ('abbage and cauliflower (2 151); artichoko (1 257); asparagus $(1\ 274)$; celery (2-286); lettuce (f.i.): spinach; rhubarb (6 396).
- i. Fruits (3-478): Orange (5 524); pears (6 100); prunes (6 298); raspberry (6-364); strawberry (7 173); nuts (5 486); apples (1-185); banams (1 359); grapes (4 61); geoseberry (4 47); temate (5 131); cucumber (8 9); marrow (5 135); etc.
- j. Foods used for their taste or flavour : sugar (7 183); spices and condiments (7-181). pepper (6 121): salt (6 490).
- k. Confectionery: chocolute (2–438), etc.
- C. Cookery (2 495) in general. Bread (2 50; 2 497); cakes (2 497); jam (4 336).
- D. Preserving Food.
 - a. Freezing (3 465); refrigeration (6 378). b. Canning (2 210).
- E. Drinks. a. Tea (7 -232).
 - b. Coffee (2 444).
 - c. Cocoa and Chocolate (2 438).
 - d. Beer (5 97; 1-96).
 - e. Spirits (7 136).
 - f. Wines (7 461).
- F. Good Manners (etiquette) (3 302); Table manners (5 152); knives and forks (4 420) and their history.

IV. CLOTHING.

- A. Textiles.
 - a. Kinds of cloth (2 418): cotton (2 516); linen (4 514); silk (7 53); rayon (6 368); nylon (5-487); woollen (7 473). b. Spinning (7 135) and weaving (7 483).

 - c. Bleaching (1 483).
 - d. Dyeing and printing (3 141).
- B. Dress and its History.
 - a. Clothes (2-420).
 - b. Hats and caps (4 136).
 - c. Boots and shoes (2-13).
 - d. Socks and stockings (4-419, 420 illus.).

 - e. Gloves (4-35).
 - f. Buttons (2-146).
- C. Making and Mending.
 - a. Sewing (7-6) and sewing machines (7-8).
 - b. Needles (5-361).
 - c. Embroidery (3-237).
 - d. Kutting (4-418).

V. YOUNG PEOPLE AND THEIR CARE.

- A. Children of many lands (2-336) and how they
- B. Children's Books (2-854); dolls (8-104).

HOUSEHOLD SCIENCE-INDUSTRIES AND APPLIED SCIENCES

- C. Nursery Nursing (2-234).
- D. Education (8-166).
 - a. Froebel (3-471) and Montessori (5-250) methods for infants.
 - b. Schools (6 508); school meals (5-153).
 - c. Universities (7-367).
- E. Careers and how to choose them (2 222).
- VI. PETS AND OTHER DOMESTIC ANIMALS.
- A. Some Pet Animals.
 - a. Dogs (3-100).

- b. Cats (2-261).
- c. Birds (2-207). ·
- d. Hamsters (f.:i.).
- B. Some Useful Animals.
 - a. Egg Producers: poultry (6 277) and ducks (3-130).
 - b. Milk producers: cow (5 203) and goat (4-37; 5-203).
 - c. For riding: horses (4-196) and pomes; donkeys (1-275; 7-270).

INDUSTRIES AND APPLIED SCIENCES

INDUSTRIES and applied sciences form the backbone of modern civilization. A complete study of their field would encompass the whole fabric of practical daily life. This Outline is intended merely as a general survey of the chief materials of industry and of the principal ways in which they are obtained and used, together with a summary of the important sources of power and methods of transport and communication.

I. RAW MATERIALS AND HOW THEY ARE OBTAINED.

- A. Minerals (5-218).
 - a. Mining (5-215).
 - 1. Coal (2-426); petroleum (6-147); natural gas (5-331).
 - 2. Metals (5-177): iron (4-288); copper (2 502); lead (4-463); aluminium (1 127); mercury (5-173); nickel (5-432); tungsten (7 324); gold (4 38); silver (7-56); platinum (6-221); manganese (5-112); etc.
 - 3. Precious stones (7-164); diamonds (3-82).
 - 4. Other common minerals: salt (6 490); sulphur (7-186); potash (1 111).
 - b. Quarrying (6-319).
 - 1. Building stones: granite (4 60); marble (5-120); slate (7-65).
 - 2. Other minerals: clay (2 406); sand (6 495); chalk (2-299); asbestes (1-262); mica (5-189).

B. Vegetable Materials.

- a. Food Crops: wheat (7-447), barley (1-368), rice (3-396), and other grams; fruit (3-478); vegetables; spices (7-131); nuts (5-486); ground nuts (4-98).
- b. Timber (7-277).
 - 1. Woods: sec articles on the various trees under their names.
 - 2. Forestry (3-422).
- c. Some other vegetable materials: tobacco (7-286); camphor (2-192); cellulose (2-287); cork (2-505); coconut palm (2-441); lacquer (4-434); natural rubber (6-464); cotton (2-516); flax (3-387); kapok (4-393).

C. Animal Materials.

- a. Domestic animals are treated in the Outline on Agriculture (8-63).
- b. Hunting.
 - 1. Furs (3 496).

- 2. Ivory (4-331); bone (1-518).
- 3. Perfume (6-123; 5-309).
- 4. Feathers (3-344).
- c. Fishing.
 - 1. Fish and Fisheries (8-377); see also articles on the various fishes.
 - 2. Sea Mammals: whale (7-445); por poise (6-265); seal (6-525); walrus (7-417)
 - 3. Reptiles (6-388); turtle (7-294).
 - 4. Shellfish: oyster (6-23); crab (2 523) lobster (4-533); shrimp (7-44).
 - 5. Other sea products: come! (2 504) pearls (6-101); sponges (7-137).
- d. Raw Materials used for cloth making silk (7-53); wool (7 473).
 - e. Other animal materials: honey (1-406, 408 diag.); lac (4-434; 6 389).

II. POWER AND HOW IT IS APPLIED.

- A. Fuel Engines: steam engine (7-152); boiler (1-504); Diesel engine (3-88); gas engine (3-507); gas turbine (7-330); Bunsen burner (2-124); internal combustion engines (4-273).
- B. Water. Dams and barrages (3-29); hydro electric installations (4-217); hydraulic ma chinery (4-215); water turbine (7-329).
- C. Air. Windmill (7–459); pneumatiq machines (6–230).
- D. Electricity (8-210). Dynamos (8-142) and batteries (1-386); electronic devices (8-221). photo-electric devices (6-162); electric motor (5-275); thermionic valve (7-377).
- E. Animals. For hauling agricultural machinery carriages, wagons, and to carry burdens horse (4-196; 1-73); ox; mule (5-292) pony (2-422); camel (2-183); llama (4-530) yak (7-511); dog (3-100).
- III. TRANSPORT AND COMMUNICATION. A. Land Transport.

INDUSTRIES AND APPLIED SCIENCES

- a. Roads (6-404); bridges (2-61); tunnels (7-325); railways (6-354); hocomotives (5-1).
 b. Vehicles: cycles (8-14); motor vehicles (5-277).
- B Water Transport.
 - a. Waterways: canals (2-204) and rivers; lakes (4-488); ocean routes.
 - b. Craft: boats (1 497) and yachts (7-28, 29); ships (7 28).
- C. Air Transport : airships (1 83); aeroplanes (1 27); "Autogiros" (1 326) and helicopters (4 157).
- D. Communication: telephone (7 240); teleprinter (7 239); telegraph (7 237); radio (6 340); cable (2 152); television (7-251).

IV. MANUFACTURING.

A. Metal Working.

- a. Industries concerned with the extraction of metals: see under metallurgy (5 176); smelting and refining (2 447).
- b. Industries concerned with shaping and finishing metals: blast-furnace (1 482); welding (7 436); electropiating (3 223).
- c. Metal products.
 - 1. See under names of chief metals in Fact-Index; see also article on alloys (1 114).
 - 2. Machinery: conveyors (2.491), dynamos (3.210); lifts and escalators (4.495); engines (see f_{1} - f_{2}) of all kinds, etc.
 - 3. Other devices made of metal: armourplate (1 244); cables (2 155); "tin" cans (2 210); firearms (3 357); artillery (1 258); clocks and watches (2-412); nails (5 313); pms (6-202); plough (6 223); cookers (2 496); stoves (4-149); wire (7 462); etc.
- B. Building Materials: iron and steel (4 288);
 granite (4 60); marble (5 120); concrete (2 476);
 bricks and tiles (2 57).
- C. Wood Products and associated industries.
 - a. Furniture (3-490).
 - b. Other products: baskets (1 378); cricket bats (2 528); bows (1 206); paper (6 62); penells (6-113); etc.
- D Ceramic Industries: china clay (2 375); porcelain and pottery (6 274); enamel (3 242); glass (4 30).
- E. Cloth and Clothing.
 - a. Processes in cloth making (2-418): spinning (7-185); weaving (7-483) and the loom (5-86); knitting (4-418): bleaching (1-483); dyeing (3-141; 7-54; 6-369).
 - b. Products.
 - 1. Cloth (2-418); felt (3-345); fabrics of cotton (2-516), linen (4-514), silk (7-53),

- wool (7 473), nylon (5 487), rayon (6 368),
- etc.
 2. Other products: lace (4 429); carpets
- and rugs (2 246). c. Clothes (2 420).
 - 1. Sowing (7-6); embroidery (3 237),
 - 2. Garments: suits; blouses; coats; trousers; shirts; hats and caps (4 186); gloves (4 35); etc.
- F. Rubber (6 464) and synthetic rubber (1 10).
- G. Leather (4 466).
 - a. Kinds of leather; chamois (4 469, 35),
 pigskin (4-469 illus.); shagreen (7 18);
 crocodile (2-533); etc.
 - b. Chief products: gloves (4 35); boots and shoes (2 13).

H. Food Manufactures.

- a. Flour milling (2 393); bread (2 50), breads (2 50); etc.
- b. Sugar and sugar products (7 183); beet(1 410); maple (5 117).
- c. Cocoa and chocolate (2 438): coffee
- (2 444); tea (7 232); salt (6 490); butter
- (2 134); cheese (2 313); margarme (5 124).
- d. Preserving food: canning industry (2 210); refrigeration (6 378).
- I. Paper Making (6 62).
- J. Printing (6 288).
 - a. Printing processes: electrotyping (f. i.): process engraving (6 292). "Limotype" (4 516); "Monotype" (5 246).
 - b. Books (2 1); nowspaper (5 403).
- K. Photography (6 169).
- L. Amusements: cmema (2 389): circus (2 403); television (7 251); radio (6 340); theatre (7 263).
- M. Miscellaneous Manufactures: drugs (3 127); opum (5 521); explosives (3 328); detergents (3 78) and soap (7 78); candles (2 210); celluloid (2 287); plastics (6 219); turpentine (7-338); musical instruments (3 507); contar (2 483).

V. ENGINEERING AND ENGINEERING CONSTRUCTION.

- A. Building Construction (2 111).
- B. Shipbuilding (7 28).
- C. Heating (4 149).
- D. Sanitation: water supply (7 425); aqueducts (1–188); reservoirs (7–425, 426).
- E. Highway and Waterway Construction: roads (6 404); railways (6-854); tunnels (7 325); bridges (2-61); harbours and ports (4-130); canals (2 204); dredgers (8 125); excavators (3-325); dams (8 29).
- F. Mine Construction (5 215).

LANGUAGE AND LITERATURE

ANGUAGE, is the tool of thought. To think clearly, and to grasp firmly the expressed thoughts of others, requires a knowledge of words and of their exact meaning, and of the manner in which words are put together into phrases and sentences. But language is a gradual growth, rooted in custom and tradition, improved by centuries of development, enriched by the skilful use of generations of great minds. The study of grammar alone will not, therefore, give the mastery of language essential to clear thought and understanding. The necessary intuitive "feel" for a tongue comes only to those who steep themselves in its great literature, past and present.

I, THE THEORY OF LANGUAGE.

- A. Philology (6 158) . the science of the growth and relationship of languages.
 - a. Etymology, the history of words (6 158).
 - 1. Etymology of English words (3 281).
 - 2. Origin of place and personal names (5 814).
 - b. Language Types (6-158).
- B. Grammar, the science of the correct use of language (4 54).
 - a. Sentence (6 531). phrases and clauses; sentences classified according to structure. b. Parts of Speech (4 55): nouns (5 468), verbs (7 390), pronouns (6 294), adjectives
 - (1-19); adverbs (1 21), conjunctions (2 484); prepositions (6 288), interjections (4 55). c. Punctuation (6 309).
- C. Rhetoric: the art of effective and pleasing use of spoken language (6-390), figures of speech (8 351).

II. THE LANGUAGES OF VARIOUS PEOPLES

- A. African Languages (6-158).
- B. Asiatic Languages:
 - a. Of China (4-445).
 - b. Of India (4 445).
 - c. Hebrew (4 151).
 - d. Arabic (3 88).
- C. European Languages.
 - a. Aryan (1-261). 1. Teutonic (7 260): English (8 281), German (4 12); Norwegian, Dutch, etc 2. Celtic (4 445). Irish (4 285); Mans, Gaelic (3 497), Welsh (7 414). Breton (2 90).
 - 3. Romance (6 427). French (3 453), Italian (4 449), Spanish (7-121); Portuguese (6 268).
 - 4. Slavonic (7-66) Russian (1 120; 5 239). Polish (6 238); Serbian, Croat, Slovene, Macedonian (7 518).
 - b. Non-Aryan.
 - Magyar (4-206); Finnish (8 354), Basque
- D. Languages of Indigenous American Peoples:
 - a. Indian (6-158, 371, 372).
 - b. Eskimo (also in Asia).
- E. Ancient Languages (1-204): Greek (4 92); Latin (4-449); Sanskrit (1-262, 6-158).

III. RECORDED LANGUAGE.

A. Writing.

a. Ideographic writing (1-119; 2-365) and hieroglyphics (4-174). (See also in FactIndex panels describing history of each letter of the English alphabet.)

b. Cunciform writing (1 336, 119 illus.;

5 176; 6-129).

c. Alphabetic writing (1 119).

d. Shorthand (7 42)

e. Methods and materials: writing (7 503), typewriter (7 341); papyrus (6 71), paper (6 62); pen (6 111; 2-3, 2 1); pencil (6 113); ink (4 261, 2 1).

B. Printing (6 288).

a. Type and Typography (7-399).
1. "Linotype" (4 516).
2. "Monotype" (5 246)

b. Products of the printing press books (2-1), newspapers (5 403), magazines, and other periodicals.

IV. FORMS OF LITERATURE.

A Poetry (6 233):

a. Lyric (3 284, 6 235).

b. Dramatic (6 235). The plays of Shake speare (7 12) are the outstanding example of dramatic poetry

c. Epic (6 235). Milton's "Paradise Lost" (5 211); Spensor's "Facrie Queene" (7 130)

- B. Prose Forms: romance (5 471); novel (5 470), essay (f.-i.), biography (1 446); autobiography (1 447), dury (3 8).
- C. Drama (3 114). Morality plays (3 118, 117 illus.).

V. NATIONAL LITERATURES.

- A. Hebrew Literature (4 151). The Bible (1-440). Job (4 377)
- B. Other Asiatic Literatures:
 - a. Arabian: Arabian Nights (1 196); the story of Aladdin (1-197).
 - **b.** Chinese (2–365).
 - c. Indian (4 249).

C. Ancient Mediterranean Literatures.

- a. Grook Literature (4 92).
 - 1. Great writers: Homer (4 189; see also stories of Odysseus, 5 500, and of the siege of Troy, 7-320); Aesop and his fables (1-45); Herodotus (4-170); Socrates (7-81), Plato (6-222); Aristotle (1 228); Xenophon (7-506); Demosthenes (3-70); Plutarch (6 228).
 - 2. Great dramatists: Aeschylus (1-45), Sophocles (7-85); Euripides (8-807); Aristophanes (1-227).
- b. Latin Literature (4 449).

Great writers: Cicero (2-387), Caesar (2-161).

Virgil (7-402; see also the story of Aeneas, 1-25); Horace (4-198); Livy (4-527); Catullus (4-450).

D. English Literature (8-288).

a. Early literature: Beowulf, the great Anglo-Saxon epic (1-431); Arthurian Legends (1-256); Legends of Robin Hood (6-416, 417).

b. Chief poets and their works: Caedmon (2-159); Geoffrey Chaucer (2-811; see also Canterbury Tales re-told, 2-312, 313); Edmund Spenser (7-180); Christopher Marlowe (5-183); Sir Walter Raleigh (6-862); Ben Jonson (4-382); William Shakespeare (7-12; see also As You Like It, 1-285; Hamlet, 4-122; King Lear, 4-409; Macbeth, 5-61; Merchant of Venice, 5-173; Midsummer Night's Dream, 5-200; Othello, 6-9; Romeo and Juliet, 6-449; The Tempest, 7-256); John Milton (5-209; see also the story of "Paradise Lost," 5-211); John Dryden (8-129); Alexander Pope (6-258); William ('owper (2-522); William Blake (1-482); Robert Burns (8-132); Sir Walter Scott (6-517); Samuel Taylor Coleridge (2-448); William Wordsworth (7-476); Lord Byron (2-147); Percy Bysshe Shelley (7-24); John Keats (4-394); Elizabeth Barrett Browning (2-94); Robert Browning (2-95); Lord Tennyson (7-257); Thomas Hardy (4-131); Rudyard Kipling (4-412); Hilaire Belloc (1-423); John Masefield (5-144); Robert Bridges (2-68); T. S. Eliot (3-291).

c. Chief prose writers and their works: Sir Thomas Malory (5-97), author of *Morte d'Arthur* (1-256; 3-284; 4-54); Francis Bacon (1 340); John Bunyan (2-125; story of Pilgrim's Progress, 2-126); Daniel Defoe (3 65); Jonathan Swift (7-204; story of Gulliver's Travels, 7-205); Joseph Addison (1-15); Samuel Johnson (4-379); James Boswell (2-22); Oliver Goldsmith (4-42); Edmund Burke (2-129); Charles Lamb (4-140); Sir Walter Scott (6 517); Jane Austen (1-311); George Borrow (2-20); The Brontes (2-91); Lord Macaulay (5-58); Thomas Carlyle (2-243); John Ruskin (6-471); William Makepeace Thackeray (7-260); Charles Dickens (8-86); George Eliot (3-229); Charles Kingsley (4-409); Lewis Carroll (2-251; extract from Alice in Wonderland, 2-252); Thomas Hardy (4-131); Robert Louis Stevenson (7-156); Rudyard Kipling (4-412); Sir James Barrie (1-372; story of Peter Pan, 1-878); Hilaire Belloc (1-423); Arnold Bennett (1-429); G. K. Chesterton (2-331); John Galsworthy (3-499); H. G. Wells (7-438); James Joyce (f.-i.); W. Somerset Maugham (f.-i.; 8-291,260 illus. f.).

E Irish Literature (4-287).

F. American Literature (7-363).

a. Chief poets: William Cullen Bryant (7-364); Edgar Allan Poe (6-232); Ralph Waldo Emerson (3-241; 7-364); Henry Wadsworth Longfellow (5-34; story of

Hiawatha, 5-35); John Greenleaf Whittier (7-364); Walt Whitman (7-449); Emily Dickinson (7-866); Nicholas Vachell Lindsay (7-366).

b. Chief prose writers: Benjamin Franklin (3-460); Washington Irving (4-296); James Fenimore Cooper (2-499); Edgår Allan Poe (6-232); Nathaniel Hawthorne (4-142); Oliver Wendell Holmes (7-364); Henry David Thoreau (7-364); Bret Harte (7-365); 364 portrait); Artemus Ward (7-366); William Dean Howells (7-365); O. Henry (7-365); Louisa May Alcott (1-97); Mark Twain (7-388); Harriet Beecher Stowe (7-364); Henry James (f.-i.); Theodore Dreiser (7-365); Thornton Wilder (7-366); H. L. Mencken (7-366); Edith Wharton (7-365); Eugene O'Neill (7-366); Upton Sinclair (7-366; f.-i.); Sinclair Lewis (7-365); Ernest Hemingway (7-365); William Faulkner (f.-i.).

G. Canadian Literature (2-203).

- H. Australian Literature (1-321).
- I. South African Literature (7-92).
- J. French Literature (8-453).

a. Early romance (5-471): story of Roland (8-454).

b. Chief writers: Jean Froissart (3-477); François Rabelais (f.-i.); Michel de Montaigne (5-248); Pierre Corneille (f.-i.; 3-119); Madame de Sévigné (3-455); Jean Baptiste Racine (6-334; 3-119); Molière (5-231; 3-119); Voltaire (7-406); Jean Jacques Rousseau (6-459); Honoré de Balzac (1-358); Victor Hugo, (4-200); Alexandre Dumas (3-133); Emile Zola (3-456); Alphonse Daudet (3-53); Guy de Maupassant (3-456; 5-448); Anatole France (f.-i.); Marcel Proust (f.-i.); Jules Romains (3-456); Georges Duhamel (3-456); André Gide (3-456); André Maurois (f.-i.).

K. German Literature (4-12).

a. Early literature: Song of the Nibelungs (5 429).

b. Some important figures: Martin Luther (5-58); Johann Wolfgang Goethe (4-37); Johann Christoph Friedrich Schiller (6-502); Heinrich Heine (4-157); Heinrich and Thomas Mann (4-14); Arnold Zweig (4-14); Rainer Maria Rilke (4-14); Albert Schweitzer (6-508).

Austrian authors of note include Arthur Schnitzler (f.-i.); Franz Kafka (f.-i.); Stefan Zweig (4-14).

L. Russian Literature (6-480).

Some noted writers: Feodor Dostoievski (3-108); Ivan Turgenev (6-480); Leo Tolstoy (7-289); Alexander Pushkin (f.-i.); Anton Chekhov (8-122; 6-480); Maxim Gorki (6-480).

M. Italian Literature (4-829).

Some noted writers: Dante Alighieri (3-45); Torquato Tasso (4-329); Petrarch (4-329; 6-384); Giovanni Boccacio (4-329; 6-384); Carlo Goldoni (3-119; 4-330); Giacomo

LANGUAGE AND LITERATURE-MATHEMATICS

Leopardi (4-330); Giuseppe Mazzini (5-151: 4-330, 316); Alessandro Manzoni (4-330); Gabriele d'Annunzio (1-159); Luigi Pirandello (f.-i.).

N. Iberian Literature.

a. Spanish literature (7 121).

Some noted writers: Miguel de Cervantes Saavedra (2-294; story of Don Quirote, 2-295); Pedro Calderon de la Barca (7 122; 3-119); Ramon Pérez de Ayala (7-122); Serafin and Joaquin Alvarez Quintero (7-122); Garcia Lorea (f.-i.).

b. Portuguese: Luis de Camoens (6 268).

O. South American Literature (7 101).

P. Scandinavian Literature.

Some noted writers: (Norwegian) Björnstjerne Björnson (f.-i.); Henrik Ibsen (4-227); Knut Hainsun (f.-i.); (Swedish) Emanuel Swedenborg (7-204); August Strindberg (f.-i.); Selma Lagerlöf (f. i.).

Q. Literature of the Low Countries.

Some noted authors: Joost van den Vondel; Jacob Cats; Desiderius Erasmus (3-295). Louis Couperus (f.-i.); Emile Verhaeren; Maurice Maeterlinck (5 72; 1-105; story of The Blue Bird, 5 78); Emil Cammacrts.

MATHEMATICS

SOMETHING of the scope of modern mathematics is indicated in the general article As a first step, however, the rudiments of the subject (as it were, the language in which mathematics is written) have to be learned.

I. ELEMENTARY MATHEMATICS.

A. Arithmetic. School arithmetic begins with the basic operations of addition (1-16), subtraction (7 177), multiplication (5 293), and division (8 96); together with other techniques necessary to the manipulation of figures, e.g. the handling of fractions (3 428) and decimals (3 57), factorisation (8 335), and the extraction of roots It then goes on to apply these techniques to various situations that arise (or are supposed to arise) in everyday life (1 237), c.g. mensuration (5-170), percentages and interest (6-122).

Nowadays the labour of computation can be lightened by the use of such devices as logarithms (5-17), slide rules (7-67), and mechanical or

electronic computers (2-167).

- B. Algebra. School algebra is concerned chiefly with the manipulation of letters considered as substitutes for numbers; the solving by this means of equations in one or more unknowns; and the application of this technique to the solution of problems (1-105).
- C. Geometry. School geometry is based on Euclid, and is often considered more valuable as an introduction to the general principles of mathematical proof than for its immediate practical application in everyday life (3 517).
- D. Trigonometry. School trigonometry introduces sines, cosines, etc. as ratios between sides in a right-angled triangle, and applies them to practical problems in the solution of the general triangle. Exercises in the proving of identities provide practice in the manipulation of the circular functions (7-316).

Spherical trigonometry is concerned with the solution of triangles on the surface of a sphere and is of practical value in navigation and surveying.

II. HIGHER MATHEMATICS.

A. Theory of Numbers. Often called the Higher Arithmetic. The field of numbers can be extended from ordinary integers to include negative integers, fractions, other algebraic numbers, transcendentals, and complex numbers

General theorems about integers are almost as hard to discover as they are to prove. They include:

- a. The Fundamental Theorem of Arithmetic. Every positive integer except 1 can be expressed as a product of primes, and in every · instance this factorisation is unique.
 - b. Dirichlet's Theorem. If a and b have no common factors except 1, then there are an infinite number of primes of the form $an \mid b$.
 - c. Fermat's Theorem. If p is a prime and nany number not divisible by p, then $n^{p-1}-1$ is divisible by p.
 - d. The Prime Number Theorem. The total number of primes not exceeding x approaches nearer and nearer to x/log x as x is made larger and larger.
 - e. Fermat's Last Theorem. The equation $x^n + y^n - z^n$ cannot be solved in integers for any n greater than 2. Fermat claimed to have a proof for this, but did not set it down. no one has since been able to find a general proof.
- B. Algebra. Strictly speaking, algobra is concerned only with processes that can be completed in a finite number of operations. An important branch is combinatorial analysis. which includes the theory of probability and statistics (5-148).
 - a. The Fundamental Theorem of Algebra. Every algebraic equation possesses at least one root in the field of complex numbers.
 - b. Abstract Algebra deals with the various different algebras that can be constructed on

MATHEMATICS-MINOR FINE ARTS

the basis of specially defined systems of elements and operations upon them (1-105).

- C. Analysis. This is the branch of mathematics that deals with continuous quantities, and uses processes involving an infinite number of operations. Its basic tool is the Calculus, which was invented independently by Newton and Leibnitz in the 17th century. It is almost all included in the theory of functions of a real variable, and the theory of functions of a complex variable.
- D. Geometry. The first step outside Euclidean
- geometry was the invention of analytical geometry by Descartes in the 16th century. The 19th century saw the development of projective geometry (in which Euclidean geometry ranks as a special case); and the working out of non-Euclidean geometries by Lobuchevsky, Bolyai, and Riemann. The tendency among scientists is towards a more and more abstract view of the subject (3 517).
- E. Foundations of Mathematics. This branch represents an increasingly rigorous inquiry into the logical foundations on which all mathematical reasoning is based.

MINOR FINE ARTS

UNDER this head are grouped Engraving (3 292), Drawing (3-123), Ministure Painting (3 258) and Illuminating (2 3; 5-116), making of Jowelry (4 371), and other artistic pursuits that have usually been dependent upon the major arts, and, though sometimes carried on by craftsinen doing nothing else, have often been practised by those who are artists in the larger sense.

I. ENGRAVING.

this heading includes very different modes of working, although the principle is the same in all: the production of a block or plate, from which can be printed numerous copies of an artist's original drawing.

- A. Wood-engraving. For centuries a great art in China and Japan. Used for the earliest illustration of printed books, and continued for its own sake, as well as for illustration, ever since. Closely allied to it, though rougher, is the line-cut, in which lineleum is used instead of wood.
 - a. Continental Work: Durer, greatest of wood-engravers (3 138); Holbein (4 185).
 b. Some 20th-century English engravers: Clare Leighton (f.-i.); Eric Gill (6 522): Robert Gibbings (f.-i.).
 - c. Japanese Masters: Hosoda Eishi (4 352 illus, f.); Hokusai (f.-i.; 4-353 illus, f.); Hiroshige (4 352 illus.).
- B. Engraving on Metal Plates. This includes line-engraving, in which the design is cut in a steel or copper plate; dry-point, in which the plate, often of zinc, is engraved directly with a sharp instrument; etching, in which the plate is covered with a layer of wax, in which the design is cut, the metal then being eaten away by acid. Many masters of all the great schools of painting have practised etching. Aquatint is often used to assist etching, as well as on its own. The plate is covered with sand or powdered resin, and bitten through this with acid, producing a finely reticulated surface.

a. Early Workers: Durer, greatest of early engravers and still unrivalled as a line-engraver (8-138); Rembrandt, greatest etcher of all time (6-382; 3-300 illus.); Van Dyck (7-379); Van Ostade, a great Dutch engraver (5-384); Leonardo da Vinci (4-482), and many others of the great Italian masters.

b. Modern Masters. In the 19th century, etching especially underwent a tremendous

- revival. The Frenchmen Meryon (f,-i,) and Legros (f,-i,; 3 300) were leaders in this revival; in Britain, Whistler was followed by Brangwyn (f,-i,; 3-273), Murhead Bone (f,-i,), and others: America's great etcher is Joseph Pennell; in Scandmavia there was Anders Zorn (f,-i,).
- C. Engraving for Reproduction. Several types of engraving are used, chiefly for the reproduction of paintings by great masters. Among these is mezzo-tinting. "Stipple engraving" is a some what similar art. In lithography (4 522; 5 295), very popular for original work, a stone block is used instead of a metal plate. This is really a method of surface-printing, not strictly engraving. Process-engraving (6 292), by means of which many books and magazines are illustrated, cannot be ranked as a fine art.

In England, the mezzotint reached very high standards during the 18th century. Notable workers in this field included Valentine Green (f.-i.), Bartolozzi (f.-i.), John Raphael Smith.

II. OTHER GRAPHIC ARTS.

- A. Drawing (3 123). Though closely allied to painting, and practised by all artists and designers, drawing in pencil, crayon, ink, pastel, co., is also an art on its own.
 - a. Early Draughtsmen: Jean Fouquet (f.-i.; 3-439); François Clouet (3 439; 2 453 illus.); Leonardo da Vinci (4-482; 3-124 illus.); Rembrandt (6-383; 3-124 illus.); Holbein (4-185; 3-124 illus.).
 - b. Modern Draughtsmen: Degas (3-449), an outstanding artist in pastel; Picasso (3-124 illus.); Sir Muirhead Bone (f.-i.); Rothenstein (f.-i.); etc. Noted illustrators and cartoonists of the 19th and 20th centuries include Tenniel, Keene, Leech, Phil May, Bernard Partridge, Beardsley, Rackham, Dulac, Will Dyson, David Low (all in f.-i.).

B. Illumination, Miniature Painting, Printing. From illuminated manuscripts came the first books, in which the illustrations were drawn separately in each copy. From the miniature pictures thus introduced came the art of miniature painting, which in England was at its best in the 16th, 17th, and 18th centuries. Together with these arts has survived that of calligraphy, or fine writing, used in heraldry, and in drawing up agreements and deeds, and taught also in some schools.

a. Illuminated Manuscripts (5-116); Book

of Kells (2-2).

b. Fine Printing, book production; William Morris (5-266) and the Kolmscott Press (5-267, 266 illus.).

III. CERAMICS.

The art of making pottery is world-wide, having been discovered independently by many primitive peoples. Porcelain, on the other hand, is an Oriental discovery, copied in Western Europe in comparatively recent times (see Pottery and Porcelain, 6-274).

a. European Pottery: Greek (4-88, 89 illus.); Roman (6-434 illus.); Portland Vase (2-89 illus.); Della Robbia (6-385 illus.); Wedgwood (6-276 illus.).

b. Oriental Pottery and Porcelain: Chinese (2-363, 369, 372 illus.); Japanese (4-351 with illus.).

IV. METAL WORK, JEWELRY, etc.

- A. Metal Work. One of the most practical of arts, metal work has been practised since pre-history, for even in the earliest times ornamental as well as useful metal work was produced.
- B. Jewelry (4 871). Closely allied to ornamental metal work, the art of making jewelry is likewise extremely ancient. See also Camoo (2 189).
- C. Enamelling (3-242; 4-372). This difficult art combines skilled metal work with jewelry.
- D. Carving. Though closely allied to sculpture, carving often entails more detailed work. Wood carving has been practised for centuries. Great carvers: Grinling Gibbons (4-19; 8-491);

Montanes (7-112). Ivory carving (4-352, 354 illus.).

V. CABINET-MAKING AND INTERIOR DECORATION.

A. Furniture (3-490). Allied with architecture, cabinet-making (2-284) has often been practised by the same men. From early times, the rich devoted great attention to interior decoration and the furnishing of their homes, even of their tombs.

From early crude works in local woods, furniture gradually became artistic. In England, the line can be traced from simply designed, often well-ornamented, Elizabethan and Tudor work through the more delicate Jacobean, to the walnut furniture of William and Mary, and thence to Chippendale (3-491, 493 illus.), Hepplewhite (3 491, 493 illus.), Sheraton (3-491, 493 illus.), and Adam (1-14; 1 217; 3-491), when mahogany and rosewood replaced English French influence was then paramount for fifty years. In the late 19th century William Morris's group of workers, among them Ernest Gimson (3-494), revived fine furniture in England. Ambrose Heal, Gordon Russell, and others have renewed interest in English woods and influenced 20th-contury design.

- B. Tapestry. Allied with interior decoration was the art of tapestry weaving (7-224, 226 illus.), now more or less dead. From the Middle Ages to the 18th century, tapestry was a usual wall covering, the most famous being that made at the Gobelins factory (f.-i.; 3-439). Artists as famous as Raphael (6-363) designed tapestries for their great patrons.
- C. Weaving and Embroidery. These domestic arts, which are of great antiquity, have now almost disappeared in the age of machines, though many examples exist in museums and private collections.

a. Spinning (7 135) and weaving (7-433).
b. Embroidery (3 237) and lace-making (4 429); Japanese embroidery (4 352 illus.); Bayeux "tapestry" (1 -389 with illus.).

MUSIC

MUSIC is organized sound; noise is unorganized sound. The composition and practice of music are arts, and should produce sound pleasing to the ear. But it must be remembered that compositions displeasing to one generation or national group may well be pleasing to another. That is to say, Man's idea of pleasurable sound is not static, but varies with the age in which he lives and the place in which he happens to be born.

I. NATURE OF MUSIC.

- A. Music (5-802) and its Physical Basis. See also Sound in the Physics Outline (8-179).
- B. Three Elements of Music.
 - a. Rhythm: regular recurrence of tone groups in which individual notes are symmetrically arranged according to accent and time value.
 - b. Melody: a succession of simple tones constituting a musical phrase.
 - c. Harmony: simultaneous blending of sounds called "chords," with interweaving "parts."

- C. Written Music (5-303, 304 illus.).
 - a. Staff and Notes.
 - b. Time in Music (7-279).

II. SOME IMPORTANT FORMS OF MUSICAL EXPRESSION.

- A. Suite: A composition consisting of several varied movements, originally intended for one instrument, now often written for an orchestra
- B. Sonata: An instrumental composition in three or four movements, for piano or for solo instrument with piano accompaniment.

- C. Concerto : A composition in sonata form for a solo instrument and orchestra.
- D. Symphony: A large scale sonata for an orchestra. A few "choral" symphonies also exist.
- E. Oratorio: A semi-dramatic choral work of large scope with vocal solos and orchestra.
- F. Opera (5-513): Musical form of drama with solos, choruses, orchestra, scenery, and acting.
- G. Cantata: A composition either sacred or secular for solo voices and chorus; shorter than an Oratorio or Opera.
- H. Anthem: A composition in common use in church services; sometimes for full choir throughout or for two choirs, and sometimes with solo parts introduced; organ accompaniment is usual.
- Hymn: A form of composition used in religious services; it varies considerably in measure owing to the variety of metres used in the words.
- J. Canon: A composition in which one part follows another over the same notes, separated perhaps by an octave, but exactly imitating its movement.
- K. Rondo: A bright movement in which the principal subject keeps recurring, in the same key.
- L. Fugue: A movement beginning with a subject in single notes, which is given out by one part and answered by other parts in turn, subject and counter-subjects forming an harmonious whole.

III. MUSICAL INSTRUMENTS (5 307).

- A. Stringed Instruments: harpsichord (6-194; 5-307 illus.); piano (6-194); harp (4 133); violin, viola, violoncello, double bass (7-401); guitar (f.-i.; 5-309); mandolm (f.-i.; 5-309); banjo (1-361).
- B Wind Instruments.
 - a. Woodwind Instruments (7 473): fluto; piccolo; fife; oboe; English horn; bassoon; clarinet.
 - b. Brasses: French horn (4 194); trumpet (7-322); cornet; trombone; tuba; saxophone (5-307, 308 illus.).
 - c. Other wind instruments: accordion (bellows-mechanism); bagpipe (1 347); organ (6-1).
- C. Percussion Instruments (5-307).
 - a. Drums (3-128); kettledrum (5-307 illus.); tympani; bass drum; side or snare drum.
 - b. Bells (1-424); triangle; glockenspiel; xylophone; cymbals; etc.
- Orchestra (5-526): a group of instruments and their players.

IV. HISTORY OF MUSIC.

- A. Hebrew Music (5-302).
- B. Greek Music (5-302).
- C. Development from the 4th to the 17th century
 A.D. (5-302).
 - a. Guido of Arezzo and the invention of the musical staff (5-303).
 - b. Rise of secular music (5-304).
 - c. Development of counterpoint (5-303).
 - d. Palestrina and the perfection of the Mass (5-304).
- D. Great Modern Composers, and their contribution to the development of music.
 - a. Henry Purcell (6-311). England's first great composer.

- b. Johann Sebastian Bach (1-839). Profound and original musical thinker; link between polyphonic and harmonic styles.
- c. George Frederick Handel (4-126). Great master of the oratorio; outstanding writer for the voice.
- d. Christoph Willibald Gluck *(f.-i.). First writer of modern opera; greatest composer of dramatic music before Mozart.
- e. Franz Joseph Haydn (4-142). Great master of the symphony and the orchestra.
- f. Wolfgang Amadeus Mozart (5 289). Universal genius in music; he raised all musical forms, except the oratorio and the fugue, to a point never reached before, and comic opera to a height "never since approached within classical limits."
- g. Ludwig van Beethoven (1-411). Greatest orchestral composer of the 19th century; profound symphonist.
- h. Carl von Weber (f.-i.). Founder of the romantic school of German opera.
- i. Franz Schubert (6 507). First, and perhaps greatest, classical song writer.
- j. Felix Mendelssohn (5-169). Flawless craftsman; much influenced by Bach, whose music he helped to bring back into favour.
- k. Frédéric François Chopin (2 378). Created a new style of composition for the piano and added a new national element to music.
- 1. Hector Berlioz (f.-i.). Master of impressionist orchestration.
- m. Robert Schumann (6 507). Romanticist composer whose songs rank with those of Schubert and his "piano lyrics" with those of Chopin.
- n. Franz Liszt (4-522). Pioneer of the symphonic poem.
- o. Giuseppe Verdi (7-391). Greatest Italian composer of the 19th century; a master of opera.
- p. Richard Wagner (7 408). Crentor of a new form of music drama; harmony, orchestration, and counterpoint were greatly advanced by him.
- q. Johannes Brahms (2-39). A prolific and versatile master of orchestration; lyrical writer for voice and piano.
- r. Piotr Ilyich Tchaikovsky (7-231). Outstanding Russian composer; master of orchestration, and of the musical expression of emotion.
- s. Antonin Dvorak (f.-i.). Made extensive use of folk-melodies, especially of Slavonic origin. t. Jan Sibelius (7 47). The greatest symphonist of the 20th century; Finland's first great national composer.
- u. Richard Strauss (7-172). Perfecter of the dramatic "symphonic poem," brilliant and inventive orchestrator, lyric and operatic master.
- v. Other composers. Britten (5-306, 515); Debussy (5-305, 515, 519); Delius (3-68; 5-306); Elgar (3-227; 5-306); Franck (f.-i.); Grieg (4-98; 5-467); Holst (5-306); Ravel (5-306); Schönberg (5-306); Shostakovitch (f.-i.; 5-306); Johann Strauss (7-172); Stravinsky (5-306); Sullivan (4-20); Vaughan Williams (f.-i.); Walton (f.-i.).

MYTHOLOGY

THE fascinating stories of Mythology (5-312) represent the first efforts of primitive people to explain the origin of the world and to solve the mysteries of life surrounding them. A study of these myths throws light on the history and customs of the people among whom they originated; and comparison of early myths shows that many were common to various peoples, suggesting possible prehistoric connexions among them. Familiarity with classical myths is necessary for a ready understanding and appreciation of many of the finest passages in literature, ancient and modern, in which allusions to these tales frequently occur.

I. BABYLONIAN MYTHS.

Etana, the shepherd who attempted to fly; Adapa, a fisherman who refused immortality; Babylonian story of the Flood (5 445).

II. ANCIENT EGYPT.

Religious Beliefs and Customs (8-183, 193, 199,

184 illus., 192 illus., 201 illus).

a. Osiris (6 6), legendary king of Egypt and chief of the gods.

b. Isis (4 301), the Moon goddess, wife of Osiris.

Greek and Roman Mythology

THE mythology of the ancient Romans, a practical people, is based on that of their imaginative and poetical Greek neighbours. For this reason Greek and Roman inythology is considered together; the Roman names are given in brackets after the Greek names, in Anglicised forms where these exist.

I. ANCIENT GREEK THEORY OF THE CREATION.

- A. The Origin of Heaven and Earth. How Uranus, Heaven, and Caea, Earth, came into being (7-370); their children—the Cyclopes (3-16), Hundred Handers, and Titans (7-522, 370: 3-17), temporary power of Kronos (Saturn, 6 500) and Rhea (7-522), and how their son, Zous (Jupiter, 4-386), became the ruler of the universe.
- B. The Origin of Man. The Greeks had several theories regarding the creation of Man. One story relates that Prometheus (6 294), son of the Titan lapetus, fashioned Man at the request of the gods. By his devotion to mankind, however, Prometheus so enraged Zeus that Zeus caused a woman, Pandora (6 59), to be made to bring trouble to Man, and ordered Prometheus to be chained to a rock. When, tator, men had fallen into evil ways, Zeus destroyed them by a flood, saving only Deucalion (f.-i.), son of Prometheus, and his wife, Pyrrha.

II. HEAVEN AND THE DEITIES WHO DWELT THERE.

The Heaven of the Greek gods was a high mountain, Olympus (1-350; 7-522), with a gate of clouds, opened by the Hours or Seasons. Each god had a separate dwelling, but at the command of Zous all repaired to his palace, where they feasted on ambrosia and nectar poured by Hebe (Juventas, 4-151), and listened to the music of Apollo (1-183) and the Muses (5-299).

- A. The Greater Gods who dwelt on Mount Olympus.
 - a. Zeus (Jupiter), son of the Titans Kronos and Rhea. Supreme ruler of the universe (4-386).
 - b. Hera (Juno), his sister and wife. Queen goddess and guardian of woman (4-386).

- c. Apollo, son of Zeus and Leto (Latona). God of light and manly beauty and of prophecy, and later, the Sun god (1 183).
- d. Artemis (Diana), Apollo's twin sister. Virgin goddess, huntress, as well as guardian, of wild beasts, and later, the Moon goddess (3-86).
- e. Ares (Mars), son of Zeus and Hera. God of war (5 136).
- f. Hephaestus (Vulcan), son of Zeus and Hora. God of fire and the blacksmith of the gods (1-10; 7 389).
- g. Aphrodite (Venus). Goddess of love, who sprang full-grown from the sea foam (7 388; 1 25, 150; 3 21,.
- h. Hermes (Mercury), son of Zeus. Cunning and swift-footed messenger of Heaven (4-85) illus.; 5 173; 6-128).
- i. Athene (Minerva), who sprang fully armed from the head of Zeus. Goddess of storms. of war and of wisdom, of spinning and weaving, and of agriculture, and protectress of cities (1 286; 1 12, 13; 6-128, 153).
- j. Hestia (Vesta), sister of Zeus and eldest daughter of Kronos and Rhea. Goddess of the hearth and divinity of the home.

B. Some Lesser Deities of Heaven.

- a. Eros (Cupid). Small god of love, son of Aphrodite (8 11).
- b. Hebe (Juventas), daughter of Zeus and Hera.
- Cup bearer of the gods (4 151). c. Ganymede: a Trojan boy who succeeded Hebe as cup-bearer.
- d. The Graces, daughters of Zeus. Goddesses who presided over social matters.
- e. The Muses, daughters of Zeus. Presided over the arts and sciences (5 299; 6-6).
- f. Themis, a Titan, daughter of Uranus. Goddess of justice who sat beside Zeus on his throne.
- g. The Fates. Controlled human destiny (8 342).
- h. Nemesis, daughter of Night. Represented righteous anger and the vengeance of the gods. i. Asclepios (Aesculapius), son of Apollo. His function was the art of healing (1-45).

- j. Boreas, Zephyrus, Notus, and Eurus. The winds.
- k. Helios, Selene, and Eos (Aurora), children of the Titan Hyperion. Helios (7-2), charioteer of the Sun, was the more ancient Greek Sun god, frequently identified with his successor Apollo. Selene was the early Moon goddess, whose attributes and adventures were later merged in those of Artemis. Eos was the rosyfingered goddess of Dawn, mother of the stars and of the morning and evening breezes (1-

1. Orion, son of Neptune. Mighty hunter. m. Iris. Goddess of the rainbow.

n. Nike (Victoria). Goddess of victory (5-47 illus.).

III. THE EARTH AND THE GODS WHO MADE IT THEIR ABODE.

The Greeks believed that the earth was a flat circle in the centre of which was either Mount Olympus or Delphi, famous for the oracle of Apollo. It was crossed from east to west by the Sea (the Mediterranean and Euxine or Black Sea), while around it flowed in a steady current the Ocean Stream (personified as the Titan Oceanus), from which the sea and all rivers received their waters. Beyond the mountains of the North Wind, in a region maccessible by land r sea, dwelt the Hyperboroans, in blus and everlasting spring. In the south, close to the Ocean, dwelt the Ethiopians, a people greatly favoured by the gods. On the western margin lay the Elysian Plain, the abode of the blessod. The dawn, the sun, the moon, and most of the stars rose out of the Ocean to give their light to Man.

A. The Chief Gods of Earth.

- a. Demeter (Ceres), sister of Zeus. Goddess of agriculture and of civilized life (3-69).
- b. Gaea, or Ge, the Mother Earth, wife of Uranus. One of the older order of gods (7-370; 3-49).
- c. Rhea, wife of Kronos and mother of Zeus. Another goddess of earth (7-522).
- d. Dionysus (Bacchus), son of Zeus and Semelo. God of wine and of animal life and vegetation (3-91, 115; 5-198).

B. The Lesser Divinities of Earth.

- a. Pan (Faunus), son of Hermes. God of the flocks and pastures, of fields and forests (6-52; 3-156).
- b. The Dryads and Hamadryads (5-488), tree nymphs; the Oreads, nymphs of the mountains and grottoes; the Napaeads, shy valley nymphs.

c. The Satyrs (Fauns). Goatlike deities of woods and fields (8-91, 116 illus.; 6-52).

IV. THE UNDERWORLD AND ITS DIVINITIES.

"Beneath the secret places of the Earth" lay a realm of darkness bounded by awful rivers—the ancred Styx and Acheron, river of woe-where Hades, whose name is given to the region, in a durk and gloomy palace haunted by strange upparitions, ruled the spirits of the dead.

A. Principal Deities of Hades.

a. Hades (Pluto), brother of Zeus, ruler of the underworld (6-228, 128; 3-69; 7-522). b. Persephone (Proserpina), daughter

Demeter and wife of Hades. Goddess of death and also of spring (8-69; 6-228).

B. Lesser Divinities.

a. Aeacus, Rhadamanthus, and Minos, sons of Zeus and judges of the dead. Minos (3-25; 7-268) during his life had been king of Crete.

b. Eumenides or Erinyes, born of the blood of wounded Uranus. Deities who punished those who had escaped from or defied justice; called in English the Furies (f.-i.).

c. Hecate. Goddess of sorcery and witch-

craft (5 259).

d. Hypnos (Somnus) or Sleep, and Thanatos or Death, sons of Night.

V. THE GODS OF THE WATERS.

A. The Older Dynasty. The Sea had two sets of rulers, the earlier of which flourished during the reign of Kronos. The Titan Oceanus and his sister and queen Tethys, from whom sprang thousands of rivers and numerous ocean-nymphs, ruled the waters from their beautiful palace beyond the boundaries of Earth. There was also Pontus (the doop sea), who was the father of Nereus, a genial old man famous for his prophetic gifts and his love of truth and justice. The children of Nerous and his wife Doris were the fifty fair Nereids (5 488).

B. The Younger Dynasty.

a. Poseidon (Neptune), brother of Zeus. Ruler of the waters (6 270; 7-522; 5 367). b. Amphitrite, daughter of Oceanus, eldest of the Titans, and wife of Poscidon.

c. Triton, son of Poseidon. A lesser divinity,

trumpeter of Ocean.

d. Proteus. Little old man of the sea. Son of Poseidon, he had prophetic powers and could change his shape at will.

e. The Harpies (f.-i.), children of Thaumas,

a son of Gaea.

f. The Graeae (f.-i.). Three hoary witches, grey-haired from birth.

g. The Gorgons. Three horrible sisters, whose glance was death (1-130, 286; 6-128).

h. The Sirens. Sea nymphs who, by their singing, lured mariners to destruction (5 501). i. Scylla. Six-headed monster destructive to mariners (5-501).

A Titan, who supported the world j. Atlas. on his shoulders (4-166; 6-128). Three groups of nymphs—the Pleiades (f.-i.), Hyades, and Hesperides (4-166)—were daughters of Atlas. k. The Oceanids, Nereids, and Naiads, sea and water nymphs (5-488). The last of these daughters of Zeus were of most importance.

VI. ITALIAN GODS.

Besides the Roman gods already mentioned, there were certain other deities always peculiar to Roman Mythology. Among them the most important were: Saturn, the introducer of agriculture (usually identified with Kronos), and Ops, his wife, goddess of sowing and harvest (later confounded with Rhea); Janus, god of doors or of beginnings, the most important native Italian deity (5-255); Quirinus, a war god, the deified Romulus; Bellona, a war goddess; Lucina, a goddess of light and of childbirth (a name applied to both Juno and

Diana); Faunus, grandson of Saturn, god of fields, of shepherds, and of prophecy (fauns were a group of woodland déities like the Greek satyrs, 3-91, 116 illus.; 6-52); Sylvanus, god of the forest glades; Flora, goddess of flowers; Pomona (4-120), goddess of fruit trees; the Lares (f.-i.) and Penates (f.-i.), household gods, the former being considered as the deified spirits of ancestors who watched over their descendants. Sol (the Sun), Luna (the Moon), Juventas (Youth), Fides (Honesty), Fortuna (Fortune, f.-i.) and other personifications were also worshipped by the Romans.

VII. LEGENDARY HEROES.

Besides these divine beings, the Greeks and Romans held in veneration a large number of demigods and heroes, some of whom were offspring of the gods.

A. Older Heroes:

a. Perseus (6-128): here of Argos, son of Zeus and Danaë, who was the daughter of King Acrisius of Argos.

b. Heracles (Hercules, 4 165): national hero of the Greeks, son of Zeus and Alemene, the grand-daughter of Perseus.

c. Cadmus (3-122; 7-266): founder of Thebes, a descendant of Zeus.

d. Orpheus (6 6): famous musician, son of Apollo and the muse Calliope.

e. Minos (3 25; 7-268): King of Crote, son of Zeus and Europa.

f. Oedipus (5-505; 7-131): King of Thebes, descendant of Cadmus.

g. Theseus (7-268; 1-130; 2-291): son of King Aegeus of Athons, a "second Hercules," slayer of the Minotaur.

h. Jason (1-226; 5-159): heir to the throne of Iolcus in Thessaly, leader of the Argonauts. i. Peleus (7-320; 1-10): grandson of Zeus, husband of the sea nymph Thetis, and father of Achilles.

j. Pelops (f.-i.): son of Tantalus.

k. Castor and Pollux (2-261): twin sons of Zeus.

B. The Younger Heroes: These were sons and grandsons of the Older Heroes and chieftains in the Theban and Trojan Wars and in numerous other military expeditions. Among them were Achilles (1-10); Agamemnon (1-66); Hector (4-152); Aeneas (1-25).

VIII. MYTHS OF THE GODS.

A. Stories of the Greater Gods.

a. Myths of Zeus: his love for Io (f.-i.); Zeus and Callisto, a maid of Arcadia (2-489); abduction of Europa (f.-i.); the punishment of Tantalus (f.-i.).

b. Myths of Athene (1-286): her birth; helping the Greeks at Troy; the naming of Athens; weaving contest with Arachne.

c. Myths of Apollo (1-183) and Artemis (3-86; 1-67): Apollo and the deadly python; Hyacinth (4-213) and Apollo; the punishment of Niobe (f.-i.); Apollo's revenge on King Midas (5-198); the musical contest of Apollo and Marsyas (1-183); Apollo's love for the nymph Daphne (3-49); the fate of Actaeon (f.-i.) at the hands of Artemis; Orion (f.-i.) and Artemis.

d. Myths of Aphrodite (7-888): birth (f.-i.); Aphrodite and Adonis (f.-i.); wedding of Aphrodite and Hephaestus (f.-i.); Atalanta's race (1-285); Hero and Leander (4-170).

e. Adventures of Hermes (5-173; 6-128).

f. Dionysus (8-91) and the pirates.

g. Abduction of Persephone by Hades (8-69; 6-228).

h. Poseidon (6-270) and the building of Troy.

B. Myths of the Lesser Divinities.

a. Myth of Phaethon (f.-i.), son of Helios, and his rush request.

b. Asclepios educated by Chiron (f.-i.).

c. Myth of the Pleiades (f. i.).

d. Cupid and Psyche (3-11).

e. Aurora and Tithonus (1-310).

f. Pan and Syrinx (6-52).

g. Echo (an Oread) and Narcissus (3-156).

IX. MYTHS OF THE DEMIGODS AND HEROES.

A. Stories of the Older Heroes.

a. Myths of Perseus (6-128): the doom of King Acrisius; Perseus and Medusa; Perseus and Atlas; Perseus and Andromeda.

b. Myths of Heracles (4-165): his youth; his labours; further exploits; death.

c. The Argonauts' quest of the Golden Fleece (1-220).

d. Myths of King Minos of Crete: the Minotaur (f.-i.); Daedalus and Icarus (8-25; 1-27, 28 illus.).

e. Myths of Theseus: Theseus and Ariadne (7-268); Theseus and Pirithous and the battle with the Centaurs (2-291).

f. Orpheus and Eurydice (6-6).

g. Founding of Thebes by Cadmus (7-266).

B. Myths of the Younger Heroes.

a. The Trojan War.

1. Its Origin: the story of Paris (7-320; 4-189), son of King Priam of Troy, marriage feast of Peleus and Thetis (7-320; 1-10); Paris abducts Holen (4-189; 7-320), wife of King Menelaus.

2. Greek Heroes who took part: Achilles (1-10), son of Pelcus and Thetis, the bravest of the warriors; Odysseus (5 500), King of Ithaca; Ajax (1-87) the Great, second only to Achilles in strength and bravery; Agamemnon (1-66), King of Mycenae, commander-in-chief of the Greek forces; gallant Diomedes; aged Nestor, King of Pylos.

3. Chief Trojan Leaders: Hector (4-152). son of King Priam, one of the nobject figures of antiquity; Aeneas (1-25), son of Anchise and Aphrodite. Among the Trojans' allies

was Memnon, King of Ethiopia.

4. Story of the War: the wrath of Achilles, the shield of Achilles; the Ambzons (1-180); the death of Hector; story of the Wooden Horse and the fall of Troy (7-820); the return of Menelaus to Greece

b. The Wanderings of Odysseus (5-500): the lotus-eaters; the Cyclops (3-16); Odysseus and Circe (2-404); the Sirens, Scylla and Charybdis, the island of Calypso, the Princess Nausicaa; Penelope (4-418; 5-500. 503) and the suitors; return of Odysseus. c. Adventures of Aeneas (1-25).

Norse and Teutonic Mythology

THE mythology of the Northmen, who inhabited the countries now called Sweden, Denmark, Norway, and Iceland, has come down chiefly through the Eddas and Sagas (f.-i.). Cradled in the frozen North, the Scandinavian myths mirror the spirit of the hardy Vikings, and while their gods lack the graceful fancy of the Greek deities, they have a rugged personality well calculated to inspire the warlike Northmen to deeds of provess.

1. THE GODS AND THEIR MYTHS.

- A. The Creation: Scandinavian myths, like those of the Greeks, tell of the development of the world from darkness and chaos. Originally there existed a world of mist, a bottomless deep, and a world of light. From the mist-world issued twelve rivers whose frozen waters gradually filled up the bottomiess deep. Then from the world of light issued warm winds which incited the ice, producing vapours which rose and formed clouds. From these clouds sprang Ymir, the rme-cold giant, and his progeny, and a cow, Audhumbla, whose milk furnished nourishment to the giant, and who in turn was nourished by licking the hoar frost and salt from the ice. At last there appeared first the hair, then the head, and at length the whole form of a god of great beauty and power. This was Bori, from whom and his wife, a daughter of the giants, sprang Odin, Vili, and Ve. These three slew Ymir and from his body and blood formed heaven and earth. Of his eyebrows they built a tence around Midgard, the destined abode of Man. Having created the world, they fashioned Man from an ashen spar and woman from a piece of elm. To these first human beings Odin gave life and soul, Vili, reason and motion, and Ve, the senses, features, and speech. The universe was supported by Ygdrusil, a mighty ash tree.
- B. Asgard, abode of the Gods, and its Chief Deities (5 500).
 - a. Odin or Woden (5-500): ruler of Heaven, Earth, and the Underworld, who lived in a golden palace called Valhalla.

- b. Frigga (1 349; 3 55): Odm's wife, who knew all things.
- c. The Valkyries: warlike virgins mounted on horseback and armed with helmet, shield, and spear, who conveyed fallen warriors from the battlefields to Valhalia.
- d. Thor (7 270; 8 55): the Thunderer, eldest son of Odin.
- e. Bragi: son of Odm, and god of poetry.

 f. Iduna: Bragi's wife; custodian of the casket of magic apples, which produced minortal youth.
- g. Balder (1 349): son of Odm, beautiful god of sunlight, spring, and gladness.
- h. Hoder: son of Odm, blind god of winter. i. Frey: god of peace and fruitfulness:
- Freyja: his sister, goddess of love, j. Tyr: a wrestler, "god of battles."
- k. Loki (1 349): the unschief-maker, who, though of the demon race, torced himself mto the company of the gods. One of his children was the Midgard Serpent, who encircled the Earth.
- C. Jotunheim and the Frost Giants, enemies of the gods (7 270).
- D. Some Myths of the Gods:
 - a. Odm at the fountain of knowledge (5 500).
 - b. Thor's visit to Jotunheim (7 270).
 - c. The death of Balder (1 349).

II. MYTHS OF NORSE AND OLD GERMAN HEROES.

In the Norse Saga of the Volsungs are gathered many ancient legends, with Sigurd, a great hero never equalled in comcliness, valour, and greatheartedness, as the central figure. The great epic, Nibelungenhed, is the German version of these hero-tales, with certain variations of name, character, and incident. Here Sigurd appears as Siegfried.

- A. The Story of Siegfried (5 429).
- B. The Song of the Nibelungs (5 429).

Interest-Questions in Mythology

What goddess sprang from the sea-foam? 7 388 How did the ancient Greeks explain the change of seasons? 3 69. Why is the laurel associated with poets? 6 232.

How did the ancient Greeks explain the origin of fire? 6-204. How did three golden apples help a hero to win a race and a wife? 1-285.

What great Greek city is named after a goddess? 1 250. What woman, according to the Greeks, was responsible for all the

ills of mankind? 6-60.

What happened when a man was given immortal life without immortal youth? 1 310.

What girl was turned into a spider? 1-286.

What god had wings on his sandals? 5-173.
What is meant when a horseman is said to "ride like a Centaur"? 2-291.

What sorceress changed men into beasts? 2-403

What woman brought disaster on herself through curiosity? 3 11. What connexion is there between "cereal" and a Roman goddess?

Who, according to the ancient Greeks, was the first man to fly?
4 228.

What flower sprang from the blood of a beautiful youth? 4-213. How, according to the Greeks, did the peacock get the "eyes" in its tail? 6-101, plate f.

riow did the Romans get the name of their chief god? 4-386.

What youth gazed at his own image until he was transformed into a beautiful flower? $5\ 324$.

How did a polished shield help Perseus to slay a monster? 6 12%. How did Odysseus and his men get past the giant Polyphemus without being caught? 5 .91.

How did the god of the vine keep a ship from moving? 3-91.

Wh. was the mischievous god that escaped from his cradle and began his adventures when only a few hours old? 5 173.

Which of the Greek heroes was called "the crafty"? 5 500.

What common metal was named after a god, and why? 5 174.

What goddess sprang from the head of Zeus? 1 286. Who was the god of music? 1-183.

What planet is named after the Roman war god, and why? 5-136
What strait was called "Oxford" in Greek, and why? 2-21.

How was the lyre invented? 5 173.

In what mythical country did women have all the rights? 1-130.

What Norse god gave an eye for wisdom? 5-500. After what god is the fourth day of the week named? 5-500. What wife of a Greek hero was noted for her fidelity? 5 503. How did a woman's beauty lead to a great war? 7-320.

After what Greek here is the tendon of the heel named, and why? 1-11.

What flower sprang from the tears of a goddess? 1 150. What power moved the god of the underworld to allow one of the dead to return to life? 6-6.

Preliminary Readings for Young Children

FOR children not yet old enough to begin Nature Study in a systematic way, the story method is the best introduction to the subject. Interested at first in the adventures of their animal heroes, they soon develop a desire to find out more about the animals themselves and the natural surroundings in which the animals live. The following stories, selected from tales to be found in these volumes, are suited to this purpose. While retaining the full imaginative flavour that appeals directly to the young reader, they serve at the same time to bring out characteristics and habits of the animals in question.

TALES OF THE ANIMAL WORLD

Why the Tortoise Bites so Hard (7·297)
The Tadpole who Wanted to be a Frog (3·473)
How Screecher Learned to Hunt (6-13)
Prickles Learns to Like his Quills (6-261)
Blackface Meets his Neighbours (6·329)

Hore Goldenreings Learned to Fly (7-169) Adventures of Blackie and Ginger (1-393) White Tail and the Old Stag's Lesson (3-61) What Simbad Found out in the Desert (2-185) The Legend of the Kingfisher (4-105)

General Outline for Older Students

THE following references provide a foundation for practical Nature Study, such as can be carried out in Britain. While some exotic creatures popular as pets have been included, in general this Outline is confined to those manifestations of plant or animal life that can be found in the British Isles, and it is so arranged as to give a broad basis on which to work. The Outlines on Biology, Zoology, and Botany should also be studied in order to grasp the scientific basis on which Nature Study is founded. It is especially useful to have read the main articles, to many of which references are given below, and to have come to appreciate inter-relationships among animals and plants, before starting field trips. It should be borne in mind that, no matter how small an area the student is forced to work in, there will be enough material for prolonged study. Outside the boundaries of Nature Study, but related to it, lies the study of Weather (7 433), Soil (7-83), and Geology (3 515).

I. NATURE STUDY (5 332).

II. PLANT LIFE (6 214).

- A. Lower Plants: bacteria (1 343); algae (1-104), seaweeds (6 526); fungi (3 488), mushrooms (5 301); lichens (4 490); moss (5-167); liverworts (4 526), terms (3 346).
- B. Flowering Plants: flowers (3 395); grass (4 63); eactuses (2 157); water plants (7 429); trees (7 308).

III. ANIMALS (1 156).

- A. Some of the commoner animals.
 - a. Lower Types: amoeba (1-140); protozoa (6 298); worms (7 500).
 - b. Arthropods: crabs (2 523); lobsters (4 533); insects (4-264); and (1 160); bee (1 405); beetle (1 412); butterflies and moths (2 136); caterpillars (2 263); fly (3 401); grasshopper (4-64); wasps (7 420); centipodes (2-291); millipedes (1 154); woodlice (7 467); spiders (7-132).
 - c. Molluscs (5 232); cockles and mussels (2-437); snails and slugs (7 73); cuttlefish, squids, and octopus (3 12).
 - d. Fishes (3-377): carp (2-245); eel (3 170); salmon (6 489); roach (6 403).
 - e. Amphibians: frog (3 472); toad (7 286); newt (5 407).
 - f. Reptiles (6 388): lizards (4-528); snakes (7-74); tortoises (7 294).
 - g. Birds (1-453).
 - h. Mammals (5 100):
 - 1. Cattle (2-273); horses (4-196) and other hoofed creatures.
 - 2. Rodents (5-103); rabbits (6-327); squirrels (7-140).
 - 3. ('ats (2-261) and dogs (3-100).
 - 4. Mole (5-231); hedgehog (4-152).
 - 5. Bats (1 380).

NATURE SILDY

NATURE STUDY ALL THE YEAR ROUND

THERE are no fixed rules for Nature Study. You may begin anywhere, at any time. You may start with the whale and work down to the tmy bacteria, or you may begin at the other end. You may start with animals or you may start with plants, but no matter where you begin if you ask questions about the common everyday things of life you will find yourself very quickly following the fascinating paths through Nature's great garden menagerie. There are two important rules to follow in finding your way through these paths. First, begin with the animals and plants that are near you, those that you can see for yourself, secondly from those that are around you, choose at the outset the animals and plants that you like the best, for love of Nature and sympathy with Nature are essential

Do not try to do too much—Among the experiments suggested pick out a few and carry them out to the end—If you try to keep four or five different kinds of pick, take care of a flower garden, cultivate vegetables, and make several different collections, all at the same time, you will not do any one thing well and so you will become dissatisfied—Pick out not more than one or two for each senson, and leave the others until next year.

While you are at work, always bear these main principles in mind

- A All Nature is unified. Livery part is connected with every other part. Plants depend on soil and climate, animals depend upon plants or upon other animals. No living thing can ever be entirely independent. Nature Study is the study of the maryellous adjustment of those relations.
- B Everything in Nature has a reason. The shape of every leaf every flower every seed, the form and colour of all animals, the arrangement of their feet, their teeth, hen fur, their feithers, the way every bird builds its nest, the way every creature looks after its young every detail of structure and habit large or small, all these things have a reason. Nature Study is the study of those reasons.

Note Reference to the Nature Notes for each month in the Through the Year Calendar in this volume will be of considerable help in suggesting what creatures or plants to look out for at any particular time. Reach for that in general the north of Britain is a fortnight or so later in spring and summer than the south, birds that are summer visitors leave earlier, winter visitors arrive earlier.

SPRING

Spring is the season of birth and awakening after the Winter months of rest. In this section of this Outline, the basis of work for the rest of the year is also given

I STUDY OF BUDS

- A Order of Opening I various the trees of your neighbourhood. See which buds open first Note the effect of a day of brilliant sunshine a day of run, a night of frost
- B How the Buds Develop—Cather twigs of beech (1 409) clin (3 236) horse chestnut (4 197) or other trees. Put them in water it home, using a fruit par or wide mouthed bottle. Place them where they will get plenty of light every day, and witch carefully the development of the buds. See how the tray leaves were curled in the bud. Note the difference between the young leaves and the young flowers, and if possible make drawings each day.

Note All good naturalists keep notebooks. A good plan is to have one small, pocket size notebook in Field Notes," and another larger, loose leaf one for Experiments." The first will cover what you see on your trips outdoors—the second what you do at home, and rough notes from the first can later be neatly written up and filed in a loose leaf system for reference. Before starting a field trip, the to have some definite plan in mind about what you metend to find and study, and make your notes accordingly. Always put down the date of the trip, where you went and what the weather was like 10 not try to write too much—just the most striking things. In your notes of experiments you hold go into greater detail. If you have to make or build anything, describe how you did it. Whenever you get a chance, male a drawing of what you see or do. Drawing is far better than writing, for once you have drawn a thing you will never forget how it looks. Never mind if your first drawings come crude, you will be surprised how rapidly you improve with practice.

II STUDY OF FLOWERING PLANTS

- A Flowers. Watch for the appearance of the first spring flowers and note them, year by year notice that trees usually bud in the spring before the smaller flowering plants spring up from the ground. Which gets warm first, the air or the ground?
- B Collecting Flowers. When spring is well under way you may start to collect wild flowers. But do not uproot rare plants
 - a. When you get home with your flowers, how do they look? How does the stem look? Notice that those you carry home in your hand suffer more than those you have kept in a tin collecting box.
 - b. Now put them in water and watch carefully what happens.

- c. Put a few of the flowers into water stained with red ink or some bright water colour. The next day cut through the stems, half-way up; examine the cut ends. What do they tell you about how flowers drink?
- d. See how many of the flowers you can name with the help of a good book about flowers (see bibliography at end of Study Outlines). Make sketches of one or two in your field notes.

Note. One way of learning about wild plants is to make a collection of dried specimens. Collect the plants when they are dry (not wet with dow or rain). When you arrive home with them, cut off any damaged leaves and lay the specimens, singly, between sheets of clean blank paper (with several sheets above and below each to allow for irregularities of outline). Arrange a specimen neatly on its the pile is ready for pressing, place on top a flat board and on this four or five bulky books. Change the paper after about 12 hours (not more). Each specimen will need to be peeled carefully off its sheet and as carefully transferred to clean dry paper. This "pressing" paper should always be dried before it is used again. After several changes, the pressed specimens will be dry enough to be transferred (singly) to the mounting paper: foolscap is a convenient size for this. The specimens should be attached to the paper by loops across the stalk of very narrow strips of gummed paper (such as that used for mending sheet-music). On each specimen sheet write the common and the scientific name of the specimen, the locality where it was found, the date, and any other relevant detail. The collection can be kept in stiff folders. Even the largest herbarium (as such a collection is called) started in this way. It should be noted that a specimen-sheet is not complete without stem (or part thereof), a flower or flowers, and (a later addition) some seeds. A thick stem will need to be reduced by sheing the back away with a razor blade. Seeds (fruit) too large for pressing should be drawn on the mounting-sheet. The root (perhaps a bulb) should also be added or drawn.

III. THE PARTS OF A FLOWER.

- A. The important parts of a flower are the peduncle (stalk), the sepals and petals (combining to form the perianth), the stamens (each consisting of the filament and the anther which bears the pollen), the pistil (which consists of the ovary containing the ovules, the style, and the stigma).
 - a. Take a flower and examine it, pulling it to pieces if necessary, and learn to recognize the parts mentioned above. If you are to learn the purposes of things in Nature, it is important to know their technical names, for this will make it much easier for you to think and observe correctly, and to describe things clearly to other people.
 - b. Remember that the primary purpose of every flower is to develop (or help to develop) seed. A fruit is that part of the flower which contains the seed; some flowers, however, are sterile and perhaps serve to attract insects to the less showy, fertile ones of the same species or variety, as in Guelder Rose (f.-i.).

IV. SEEDS (6-528).

- A. Seed Structure. Get a handful of dry broad beans (1 390). Examine one of them carefully Notice the small knob on the inner edge. That is part of the young plant or embryo. Peel off the tough outer hull, called the seed-coat or testa. Notice how the maide of the bean is divided into two halves, which are united only at the young plant. These halves are called the cotyledons.
- B. The Seed Comes to Life. Fill a small wooden box with moist soil. Sow a few of the beans a quarter of an inch deep, and mark with a match where each is. Keep the soil moist, but not solden.
 - a. After two days, dig one of them up, and note what has happened to the embryo and the seed-coat. Every other day dig another up very carefully and observe the development of the rootlet (called the radicle), of the first small leaves (called plumules), of the stem What has become of the cotyledons?
 - b. Note how long after sowing the first stem appears above the soil. You will sep that it is arched; the root end is the anchor, and the other side of the arch is pulling upwards just as hard as it can to free the first leaves.
 - 1. The cotyledons are simply storage houses for the embryo's food. When we eat cooked beans we are nourished by the food that was intended to give the sprouting bean plant its first start in life.
 - 2. Here is a simple way of testing this. The food stored in the cotyledons is mostly starch. Iodine turns blue when it touches starch; the more starch there is, the deeper and darker the blue. Keeping that in mind, put a drop of weak solution of iodine on one of the cotyledons, when a bean first starts to sprout. Note the colour Now put a drop of iodine on a cotyledon after a young bean plant has straightened up above the ground. What change do you notice, and what does it indicate?
 - 3. An even simpler test is to remove the cotyledons from one of the young plants day after it appears above the ground, and then compare its rate of growth with the of the others.

C. Differences in Seeds. Study the seeds of other plants. Sow seeds of onion, lilies, radish, nasturtium, pansy, hollyhock, sunflower, cabbage, pine or fir tree, or any other available kind, selecting a half-dozen as varied as possible in size and shape. Note how each behaves in sprouting. (Be sure to label each group of seeds so that you can identify the seedlings.)

Note. Some seeds have only one cotyledon. This is an important point in the scientific classification of plants, all the most highly developed plants and trees being grouped as either Monocotyledons (with one cotyledon) or Dicotyledons (with two or more cotyledons). The pine, belonging to a lower group (see Outline on Botany), has a number of cotyledons.

V. MAKING A GARDEN.

- A. Remember that you, as a Nature student, are interested in the lives of your garden vegetables.

 Learn to know them all, how they germinate, what their flowers are like, and other similar details.
- B. While you are taking care of the garden, learn the reuson for everything you do. Why should the soil be dug and made fine before sowing seed? What harm do weeds do? What are the chief enemies of your garden, besides weeds?

Animals and plants are intimately connected in Nature. Where there are no plants, there can be no permanent animal life, for plants are the original manufacturers of all food, and animals live upon this food, directly or indirectly. If some are able to exist as flesh eaters, it is because they live upon others which eat vegetable food. It follows, therefore, that the structure and habits of all animals are closely associated with the character of their plant neighbours.

VI. FAMILIAR PETS.

Note. Begin your study of animals with those nearest to you. Such studies are intended to bring out some of the most striking points in the bodily structure of these familiar animals, points which you might perhaps overlook, but which illustrate the great fundamental law of natural fitness. By the use it intelligence, men train themselves to be fit for special tasks. But the fitness of animals for the many different lives they lead has been developed through untold ages by Nature. During the long time that Man has been breeding domestic animals to suit his own needs, these animals have changed greatly in appearance, but they retain most of the forms, instincts, and habits that were so useful to their wild meesters. A study of these forms and habits, therefore, will be most useful in helping you to work out problems of wild life.

A. Dogs and Cats.

Examine a Dog and a Cat. Observe the extraordinary length of their eye-teeth or "canine" teeth, characteristic of the carnivorous or flesh-eating animals. Does a cat behave in the same way when you give it a saucer of milk as it does when you give it a piece of meat? In the same way, note the differences in the general build of a cat and a dog, their claws, eyes, fur, etc., in relation to their different mode of life.

B. Other Pets.

Examine the front teeth of a rodent (5-103) such as a rabbit (6-327), guinea-pig (4 105), or mouse (5-288). How do they differ from the teeth of the cat and dog?

C. Bird Pets (2-207), and Poultry (6-277). Gather as many interesting notes as you can about the habits of bird pets, such as canaries and pigeons, and farmyard poultry. How do birds get along without teeth? How do the beaks of one species differ from those of another in relation to their food? Notice the arrangement of their claws. Notice particularly how bright and active little chicks are as soon as they break out of the egg. Compare them with young pigeons. Remember that chickens are descended from birds that nested and spent most of their lives on the ground, where the young, if they were not alert from birth, would be at the mercy of every chance foe. Pigeons, on the other hand, are descended from birds that built their nest in high, inaccessible places, where the young were comparatively safe.

VII. FARM ANIMALS: Horse (4-196); cattle (2-278); sheep (7-20); pig (6-196); goat (4-87).

- a. Watch these animals when they are feeding. See how they gather up the grass. Do they stop to chew? Watch them when they are lying down after feeding. What are their jaws doing? Are they chewing the cud?—a`remarkable habit. Read about it in the article on Cattle. Do horses or pigs "chew the cud" in this fashion?
- b. Notice the feet (3-412; 5-102) of these beasts. How many toos have they? Look again and see if you can see two more. Nearly all Mammals, except elephants, bears, monkeys, Man, and a few other groups, walk on their toes. Some walk on one toe, like the horses, some on two toes, like the cow; some on four toes like the cat and dog. In each of them, traces of the remaining toe or toes are to be found higher up on the leg. The

- "hock" on the hind leg of a cow or horse is really the heel, while the "stiffe" is the "knee. What we call the "knee" on the front leg is really the wrist.
- c. Examine the teeth of cattle, sheep, pigs, and goats. Remember that the organs for eating and moving usually indicate the habits of animals.

VIII. WILD BIRDS (1-458).

A. Bird Diary.

Right at the beginning of the year you can start a bird diary, for British resident birds are moving, singing, and building their nests long before summer visitors begin to arrive. Notice, too, the movements of the big flocks of starlings, finches, and other birds, as well as those of winter visitors. In later spring, you will be kept busy with notes on the arrival and departure of various migrants. Observe when various species start to sing, when they get their breeding plumage, when and where they first begin to build. A bird diary, even if your activities are confined to one small garden, may have several entries for every day of the year.

B. Nest Boxes.

Build small bird-boxes. Place them fairly high up on big trees, not too close to the house. Keep a good watch on them and note which birds use them or inspect them, when they begin to build, etc. Be careful not to disturb them by going close too often, and resist the temptation to look inside and see what is going on! A pair of field-glasses or a small telescope will help you to observe birds at a distance that does not disturb them.

C. Field Notes on Birds.

a. Watch for birds' nests on your field trips. Note the position of each with small sketch maps in your notebook, so that you can return from time to time to watch the progress of the feathered families. Notice the size, shape, and colour of the eggs. Do not yield, however, to the temptation to collect birds' eggs. A blown egg in a box at home soon becomes uninteresting; but an egg left untouched in the nest will quickly turn into a young bird. Do not, moreover, visit any nest more than once a week, or the parent birds may desert it. When the young have gone you can examine the nest and note the materials of which it is made.

Try your hand at sketching some of your favourite birds. Make sketches from your personal observations. There is little profit in copying someone else's drawings. Try filling in the outlines of the sketches with water colours.

c. Learn to identify birds by their song and their manner of flying as well as by their shape and colour. Use a good book for this.

IX. THE LIFE OF STREAM AND POND.

A. The home aquarium (1–187).

One of the most delightful ways of studying Nature is to keep an aquarium at home. You might begin modestly with a small fruit jar, or you can buy a small glass tank, or build yourself an oblong aquarium with plate-glass sides cemented into a wooden or metal frame.

- a. Plants for the aquarium. Cover the bottom of your aquarium about one inch doep with clean sand. Go to the nearest pool or stream and gather small water-plants, taking a little of the mud or stones on which they are growing. Read the article on water-plants (7-429), and try to identify all the plants you collect. Arrange them in your aquarium, and leave alone for a few days.
- b. Animals for the aquarium. Gather in a net or in glass jars any of the water creature you find in the same place as you found the plants. For this purpose, a shallow net of strong netting, stretched on a cross-stick frame, will do very well. Just comb it through the water-plants or along the muddy bottom.
 - 1. Get some water-snails, some of the smaller water-boetles and other insects. A few will be enough to start with. If you find in your net strange insect-like creature-that you cannot identify, place them with a few plants in separate jars. They are probably insect larvae, such as the larvae of dragon-flies (8-112), which are very fierce and would kill your other captives if placed in the same aquarium. Later you can add small fish to the collection.
 - 2. If the water in your aquarium tends to become cloudy, change it and try putting in a few more, or taking out a few, plants, and watch the effect. Experiment until the water remains clear without changing. Such an aquarium is said to be "balanced," the plants providing the oxygen that the animals need, and the animal the gas (carbon dioxide) that the plants need. Water-snails are especially useful for keeping the water and the glass clear. (Read the article on respiration, 6-389.)
 - 8. Cover the aquarium with cloth netting or a wire screen to prevent such insects v water-boatmen from flying away. Always keep the water cold. Do not let directly rays of the sun shine on the aquarium.

c. Raising Frogs and Toads. Go to a pond where there are frogs (3-472) or toads (7-286), and collect their jelly-like spawn. Place these egg-masses in an aquarium, and watch them develop. Note carefully the stages through which each egg passes.

SUMMER

In summer you continue your general Nature observations and notes, always bearing in mind that now all animal and plant life is growing, developing to maturity, preparing for the fruition of Autumn.

- I. PLANTS AT WORK. Review in detail the article on plant life (6-214).
 - A. Leaves (4 469). Read this article carefully.
 - a. Start a Collection of Leaves. Follow the detailed directions given for the flower collection (8-161, 162). Be sure to identify each leaf, noting the principal points that distinguish it from other kinds of leaves.

Note: Remember, in looking up the names of plants and annuals, that they often have different popular names in different parts of the country. If you cannot find a certain name in your Nature books, consult a good dictionary, and you will possibly find that the plant or annual in question is more widely known under some other name, which will be the one used in your books.

- b. Leaves and water. Suspend a drinking glass mouth downwards over a well-watered growing plant, so that some of the leaves are imprisoned inside the glass. Cover the soil with oiled silk. Leave it overnight. What do you find on the inside of the glass in the morning? Where did it come from?
- c. Leaves and light. Place a house plant, for instance the so-called geranum (3 524), in a room that has only one window. Examine it a week later. Which way are all the leaves facing? What must you do with a potted plant to make it keep its shape in such a room?
- d Leaves and their work. If the loaves are stripped from a plant it will stop growing, and if the stripping continues for long, the plant will die. Why is this? Notice that when there is a bad attack of defoliating caterpillars such as those of winter moths, trees may be so weakened that they are attacked by other posts; if this happens several years running, the trees may die.
 - 1. Crush a loaf m your fingers. Can you see the green colouring matter (chlorophyll) separating itself from the pulp?
 - 2. What kinds of plants can you find that are not green? Read the articles on fungi (3 488), mushrooms (5-301), and look at 6 215, illus, of toothwort. Do you know now why mushrooms can be grown in dark cellars, where green plants would die?
- B. Flowers (3 395).
 - a. Select a few common flowers for study. Identify the different parts of each flower, as you did when working on spring blossoms.
 - 1. Touch the anther at the tip of the stamen in one of your flowers with your moistened finger. Note the fine yellowish dust that comes off. That is the pollon.
 - 2. Read the section on the parts of a flower (8-162). Now cut your flower open carefully and see if you can find the parts there described.
 - Go out in the evening and notice how flowers go to sleep at night (see 6-218 illus. of waterlily).

Note: An evening or night walk is full of interest at all times. Watch for flowers that are open, for bats (1-380), glow-worms (4-36), and many moths. Listen for birds that sing or cry at night, for instance the nightjar (5 438) and the owl (6-11). If you are quiet you will hear all sorts of animals moving.

II. POLLINATION OF FLOWERS (3-396, 399, 400).

The fertilising pollen is carried from the male anthers to the female stigmas in various ways. While it would be possible for many flowers to fertilise themselves, Nature in general avoids this, arranging for cross-fertilisation whenever possible; indeed, cross-fertilisation is essential if the race is to continue strong and vigorous. Many flowers are therefore of one sex only, bearing either stamens or pistils, but not both. In some trees this is most noticeable: thus you often see a holly tree that never bears berries, although it flowers frequently. Make a note of such a tree and examine its flowers in spring: they are all males. Cross-pollination is brought about in various ways. If the anthers ripen first, the plant is said to be protandrous; if the stigmas ripen first, it is protorogynous.

A. Insect pollination. You can see this by examining almost any flower that attracts insects. Notice that when a bee enters the flower, it brushes against the anthers, collecting some of the yellow pollen (often it has gone to the flower expressly to collect pollen to make "bee-bread," 1-405, to feed its grubs on). The pollen on the bee's legs or back rubs against the sticky

stigmas of the next similar flower visited by the bee, and fertilisation is ensured. Some orchids are fertilised by moths which take away the whole pollen-sac, called a "pollinium," and if you examine the heads of these moths you find such sacs sticking to them. Some flowers are pollinated by one species of insect only.

- B. Wind pollination. Notice the masses of yellow dust in the pine woods. This is pollen, blown from the curious catkin-like male flowers, and floating about until it comes to rest on a young female cone (3 484). Most conifers and other big trees are pollinated in this fashion; so are early flowering trees, such as cherries, which bloom before insects are about. But they also bloom before there are any leaves, and their petals open exceptionally wide, giving the pollen a better chance of reaching the stigmas.
- C. Other Types. A few plants are water-pollinated, the pollen being floated on the surface of pond or stream; these are, of course, water-plants whose blooms are close to, or on, the surface. Some tropical species are pollinated by small birds such as humming birds. Self-pollination occurs in early flowers such as crocus (2 533), parcissus, etc., and may occur in others if they have not been visited by insects, the anthers bending inwards to the stigmas in the later blooms.

III. SEED PRODUCTION: the transformation of the flower into fruit (3-480) and seed (6-528).

- a. Watch a flower as it fades and note what happens to the various parts. Remember that from the point of view of the plant, the purpose of the flower is simply to produce the seed.
- b. Make notes of the seed development on the trees and other plants of your neighbourhood.
- c. Find how flowerless plants, like ferns (3-346), mosses (5 167), and liverworts (4 526), reproduce themselves.

IV. WHAT PLANTS NEED FOR LIFE.

A. Light.

Sow half a dozen French beans in a box or flower-pot and put it in a dark place. Give the seedlings the water they need. Note how they differ from others rused in the light.

B. Water.

Sow three separate colonies of French beans. Keep one colony soaked with water; keep the second colony moderately damp; and give the third colony no water at all. Compare the results

C. Air.

Sow some French beans inside a fruit jar and keep the top screwed on tightly. You will not have to water them, since no water evaporates. Watch what happens.

D. Minerals.

Besides the article on plant life (6 214), read also that on soil (7-83).

V. INSECTS AT WORK.

- A. What is an Insect (4-264)? Be sure you know one when you see it. Is a spider (7-132) an insect?
- B. Social Insects: Ants (1-160); boos (1 405); wasps (7-420).
 - a. Studying Ants at Home. Get a large fruit jar and fill it two-thirds full of moderately damp earth -a soil containing a fair amount of sand is best. Find a nest of ants, any one of the smaller species that build in the ground, and capture its inhabitants. A good way to do this is to scoop up the whole nest with a garden trowel and put it, ants and all, straight into the empty jar. Be careful not to injure the ants, or the larvae and pupae. The larvae are tiny white grubs, the pupae are like grains of rice. Also search carefully for the queen, which you will recognize by its greater size.
 - 1. Transfer all your captives to the jar you have prepared, and fasten over the top a fine screen or a paper punched full of pin holes. Now make a cylinder of heavy black or dark brown paper which will fit snugly round the outside of the jar, yet be free to slide up and down. Put a little sugar, some bits of raw apple, or some tiny pieces of meat in the jar, and place it for a few days in a corner where there is not much sun.
 - 2. After some days, slide the paper cylinder down, and you will find the ants have made galleries down the sides, just inside the glass. They have taken advantage of the fact that the glass offers them support for one side of their tunnels. You may watch the structure of the tunnels for a few minutes, but do not leave them exposed to the light too long, or the ants will abandon those tunnels and dig out of sight
 - 8. Make notes on the way the ants work, how they eat, how they look after their young etc. New larvae and pupae of the same species will be welcomed, cared for, and brought up most carefully. If at any time the soil seems to be drying up, scatter a few drops of water inside the jar. Feed the ants from time to time on fruit or meat

b. Field Work on Ants. Dig carefully into and examine the nests of different sorts of ants,

capturing specimens of the inhabitants and identifying them.

The nest of the big wood ants is the easiest to study. Some way from the nest you will find a trail leading inwards and outwards, with a stream of workers moving along it. In the nest itself, if you can pluck up courage to sit down and really examine the inside, you may find some beetles and other insects that are the "guests" of the ants, secreting "honey-dew" for the ants' benefit and being fed in return. Some of these guests are also scavengers in the nests. Other ants live beneath the bark of trees, under stones, or in old masonry. Look, too, for the ants that "milk" the aphides or greenfly (1 182) on garden plants—especially the roses—and notice how carefully they look after these "cows." When the hot, sultry, thundery weather comes in mid-summer, watch the mating flight of the male and female ants, and how the winged forms break off their wings when this flight is over. Notice that this flight always occurs during certain weather conditions (generally close and thundery).

C. Insect Transformation (4-265).

- a. Caddis Flies. To study these you will require an aquarium as described above, page 164. Go out to the nearest pond or stream and examine the shallow water near the edge. If you look long enough you will probably see some small bundles of criss-crossed sticks and bits of stone, which move about in a mysterious way. Scoop a few up and carry them home in a jar of water, and put them in your aquarium. They house the larvae of Caddis Flies (f.-i.). In time these larvae turn into pupae and then, a little later, they will emerge from the water as adult, four-winged flies.
- b. Caterpillars (2-263). Find caterpillars of various types. Take them home and keep them in a well-aired tin, or a box one of whose sides is covered with zinc-gauze or muslin. Keep them on sprigs of the tree or plant on which you found them, and renow these sprigs daily. See that the caterpillars get plenty of light, but no direct sunlight. Clean the bex'each day, removing all the food but that upon which they actually are. They will crawl of their own accord on to the fresh food. Do not touch the caterpillars if you can help it. When they are full-grown after changing their skin several times, see that there is an inch or two of earth in the bottom of the cage or box, also bits of bark. If you can identify the caterpillars, you can find out where they will pupate. Some go underground, others make a silken cocoon in a corner of the box, others weave leaves together. Some will emerge as adults this year, others may wait until next spring. If you have a male and female adult of the same sort, they may mate and you will then be able to breed more from their eggs.

VI. BIRD LIFE.

A. Summer Activities. Continue your spring-time notes, with especial reference to the young of the birds you have seen arriving. Notice their plumage, its differences from that of their parents; observe how the parent birds stop singing and begin to moult after the breeding season. Ducks (3 130), for example, go into an "eclipse" plumage.

B. Feathers (3-344).

a. Examine all the feathers you can find. Cut up a feather, examine the quill. Pull apart the "barbs," which make up the flat part or "vane" of the feather. Examine the structure of these barbs through a magnifying glass.

AUTUMN

Autumn is the season of fruitfulness. Plants, which have reached maturity or gained new vitality in the summer months, now put forth their seeds and fruit. New generations of animals are growing up. All Nature is busy preparing for Winter.

I. SEEDS AND SPORES (6-528).

- A. Seeds and Fruits: Make a collection of seeds, or observe and draw those of all the plants you can find in your neighbourhood. Note how the seed-containers are attached to the plant, and see how each is adapted to distribution
 - a. By Wind: Observe fruits of the ash (1-263), sycamore (7-215), and pines (6-203).
 - b. By Animals: This happens in two ways. Notice the burns of burdock (6-529 illus.)—these catch in the fur of passing animals, and the seed is thus carried to a distance. "Fruit" is simply pulp enclosing seeds; it attracts animals as food; the animals swallow the seeds and excrete them far away from the parent plant.
 - c. By Birds, for example, mistletoe (5-228) and yew (7-513).
 - d. By Water: Alder (1-97) seeds are dropped over streams, and float to a resting (and rooting) place.
 - e. "Mechanical" distribution: Seeds of hairy bittercress (1-477) and some other plants are expelled violently from their pods to a distance of a foot or more.

B. Spores:

- a. Ferns (3.346) as Examples of Spore-bearing Plants. Examine the under side of fern fronds until you find one with many little brown or black dots. These are the "spore cases." What is the difference between seeds and spores? Do ferns have flowers?
- b. Mosses (5-167) and Liverworts (4-526). Note the differences between them and the ferns.
- c. Fungi (3-488) and Mushrooms (5-301). This is the great season for these parasites and saprophytes. Notice the different types of fungi, the way they grow and how they spread. Examine "fairy rings" (3-339). Make a collection of the special insects found in connexion with these fungi.

II. HOW PLANTS GROW.

- A. Trees (7-808) as Examples of Growth.
 - a. Examine a Tree Stump. Note the rings in the cut surface of the wood. You can tell the age of the tree by counting those rings. Which is harder and tougher—the heartwood near the centre or the sap-wood near the bark? Peel off the bark and try to identify the cambium.
 - b. How Sap Circulates. In summer or spring, select on a growing tree a small branch that can be destroyed without harming the tree. With a sharp knife cut off a narrow ring of bark, so as to leave a bare strip completely encircling the small branch. Be sure you cut through the cambium to the woody fibre. Now watch that branch daily. Before long it will die from the ring to the tip, for the circulation of the life-giving sap has been stopped.
 - c. Autumn Foliage. Notice when the leaves in your neighbourhood begin to change colour, and observe the order in which they change, and fall. Gather leaves from the different trees of your neighbourhood after they have changed colour, and put them with the summer leaves in your collection.
- B. Roots (6-451) and Their Work (6-216 illus.). Dig up any small plant, taking plenty of soil with it. Now wash off the soil carefully so as not to injure the roots. Examine the fine root-hairs.
 - a. Read about the remarkable process of root pressure (6-216), and if possible perform the interesting experiment shown in the picture.
 - b. Next read the article on soil (7-83).
 - c. What are the underground parts of plants besides roots? Read the article Bulb (2-118), and plant examples of the various plant storage organs in pots indoors, setting them uside until the winter or spring—crocus corms, narcissus bulbs, tubers of potato, Solomon's seal rhizomes.

III. ANIMAL STUDIES.

- A. Spiders (7-132) and Their Webs.
 - a. Notice the different types of web and their owners. Agitate a big "orb" web by moving a blade of grass against it. Watch the behaviour of the spider. Make a drawing of the web pattern. Now poke a hole in the web with a stick. Come back the next day, and you will probably find the web mended. Notice by comparison with your drawing how the patch was put in.
 - b. Notice the difference between the spiral threads and the coarser cross-threads of the web. Why are some elastic and others rigid?
 - c. Study beneath a lens the remarkable structure of a large spider and note especially ways in which it differs from insects.
- B. Snakes (7-74): Lizards (4 528). Remember that there is in Great Britain only one species of poisonous snake—the adder or viper. The other snakes are harmless.
 - a. You may examine a grass-snake (4-65) without fear. Note the absence of eyelids. See how the scales on the under side are arranged so that they catch in the ground and help the snake to pull itself along. You can feel the scales pulling if you let the snake crawl over your hand.
 - b. Try to catch a slow-worm, or a legged lizard. These make interesting pets and are not difficult to keep in captivity. Compare your slow-worm with a snake; you will see that they are quite different.

IV. ANIMAL PREPARATION FOR THE WINTER.

A. Storing Away Food:

a. Outside Storage. Watch a squirrel during the autumn months. Throw nuts where it can find them, and try to see what it does with them.

- b. Inside Storage. If you can catch a hedgehog (4-152) or a dormouse (3-107) in the autumn, notice how very fat it is. It is storing its winter's food inside its body in the form of fat.
- c. What other animals do you know that hibernate (4 173)?

B. Migration (5-202).

- a. Birds. Watch during the autumn months for the southward migration of birds. What kinds leave your neighbourhood? Note when you last see them. Notice, too, that some sing a little before leaving, while others are silent. Discover what kinds pass through your neighbourhood from the north—these are "passage migrants."
- b. Other Types of Migration: eel (3-170; 5-202); salmon (6-489; 5-202).

WINTER

This is the season of rest. Most of Nature lies dormant awaiting the call of Spring to burst forth into new life. But for those animals which neither migrate nor sleep through this season Winter is often a period of hard struggle and hunger.

I. PLANT LIFE IN WINTER.

A. Evergreens (f.-i.).

- a. Conifers (2 483). Make a list in your notes of all the cone-bearing trees you can find and identify in your neighbourhood; notice and draw the arrangement of the needles, the form of the cones, and the shape of the tree as a whole. Notice that some cone-bearing trees shed their needles in the winter (e.g. the larch, 4 447).
- b. Other Evergreens: laurel (4-455): holly (4-187); holm oak (5 490),

B. Trees that Lose Their Leaves (deciduous).

- a. Bark Formation. Winter gives you an opportunity to learn to know trees by their bark. Study the trees of your neighbourhood until you can recognize them in this way. In your leaf collection make sketches of the bark of the tree to which each leaf belongs.
- b. Arrangement of Branches. Note that nearly every species of tree has a shape and arrangement of branches different from others. An interesting experiment for winter field trips consists in guessing the names of trees from a distance, judging merely from the appearance of the branches against the sky, then verifying them by closer inspection of the bark or twigs.
- c. Twigs. The examination of the twigs is a sure way of identifying trees in winter. Notice that some twigs—for instance, those of the walnut (7-416), birch (1-452), and hazel (4-143), now bear the young, tightly-closed catkins of next year's flowers, while others still bear bunches of fruits (hornbeam, 4-195).
- C. Winter Sleep of Plants. Learn to distinguish annuals, biennials, and perennials (6-218). Note that nearly all plants whose seeds are used for food are annuals, for example wheat, oats, beans, peas. Nearly all plants whose roots or leaves are used for food are biennials, for example, carrots, turnips, beets, cabbages. In annuals the parent throws all its strength into the seed and then dies; in biennials the first year's strength is thrown into the production of root, stem, and leaf.

II. ANIMAL LIFE IN WINTER.

Although certain animals are asleep (or hibernating), many others are about, and there is ample opportunity to observe these.

A. Deer (8-59) and other Mammals. The antiers of red deer, common in parks all over Britain, are at their best. In autumn the deer "rutted," fighting fiercely for the collection of hinds that now follows each one meekly about. Roc leer, on the other hand, have mated already, and the bucks have lost their little pointed horns. If there is snow, you can find tracks of animals: foxos, cats, dogs, rats, weasels all leave characteristic footmarks, which you can learn to recognize with a little practice. Make drawings of each type of track and, if possible, add the measurements between the footmarks in every direction so that you can gauge the size of the animal.

B. Birds.

a. Winter Visitors. Birds also leave tracks in the snow, and this gives you a chance to see the different ways in which they move on the ground. Thus, rooks (6 499) walk, members of the thrush (7-271) tribe hop, wagtails (7-409) run. Sea-birds such as gulls (4-105) come inland and leave strange markings with their webbed feet; the curiously leaf-like toes of the moorhen (6-353) also make a very distinct track.

Then there are the winter visitors; go to your nearest large pond and see how many kinds of duck (3-130) you can find. Notice that they are as easy to distinguish in flight

as on the water. Rare birds from the far North may be seen here, too; and all sorts of unusual wading birds (7-408) visit the mudflats on big marshes.

- b. Flocking and Small Migrations. Notice how many common birds gather into big flocks in winter. Finches (8 352), starlings (7-151), and green plovers (6-226) are the most noticeable, unless you live near the sea, when flocks of waders are conspicuous on the shore. Coots (6-353 with illus,) form big congregations at this time of year. There are all sorts of interesting small migrations to be watched even among the common birds of the garden. Thus, robins, thrushes, and other birds are much bolder when hunger drives them, and species not usually seen in the garden may put in an appearance at the bird-table. Put out a good supply of food of all sorts: but make sure to put it where cats cannot reach it or get at the birds.
- C. Insects. Many insects rest in the winter, often in an immature stage. On the apple trees, for example, you may find the eggs of the lackey moth (f.-i.) laid in neat bands round the twigs; on other trees are other eggs, while every cranny of the garden shed may shelter a chrysalis or cocoon, from which in the spring you can rear the butterfly or moth. If you dig an inch or so down beneath big trees, such as oaks, you will find more pupae. Beetles, wood-lice, and many garden pests are ever active, while a few butterflies come out on any warm sunny day. After the New Year, start looking out for their first appearances for your new Nature Dury. Remember that Nature's year has little to do with that of the calendar, and your new diary may well be as full of entries in December, January, and February as it will be in spring and summer.

Interest-Questions in Natural History

"It has a beak like a duck, hair like a cat, and a tail like a beaver. What fish sleep through the dry season in balls of mud? 5 51 It has four legs and web feet. Where do hermit crabe live? 2-523 illus.

PAINTING

PAINTING (6-38) and the closely allied art of drawing (3-123; see blso 8-153) are the oldest arts practised by human beings. Used by prehistoric Man on the walls of his cave-dwellings to depict the animals he knew and to record aspects of his way of living, painting came to be used in Europe chiefly, at first, for the representation of religious ideas and figures; only gradually did it branch out into portrature, landscape, and still life. In the Orient, on the other hand, landscape was the favourite subject.

I. PRIMITIVE.

Stone Age (2-282; 7-161). Spirited paintings done in three colours on the walls of caves, often with incised outlines, give evidence of the adroitness of hand and keenness of observation of the men of the Old Stone Age (2-279 illus.; 5-105 illus., 109 illus.).

II. DEVELOPMENT IN THE WEST.

- A. Egyptian (3-194, 195, 199 illus.; 6-33). Paintings intended not only to decorate walls, but to furnish historical records; conventionalised and symbolic figures often done in brilliant colours which were decorative but not realistic.
- B. Babylonian and Assyrian (6-33). Human figures less conventionalised, but also less spirited; animals more truly portrayed than by Egyptians.
- C. Aegean (1-24 illus.). Aegean art showed extraordinary power and vigour, less knowledge and accuracy than Egyptian, but greater artistry; animals and plants delightfully rendered.
- D. Greek and Roman (4-89; 6 33, 440).
 - a. Greek. Ancient writers tell of the fine work of Polygnotus (4-89), the reputed founder of Greek painting; of Zeuxis; Parrhasius (f.-i.); Apelles (f.-i.); and others; but their works have perished. Only vase-paintings (4-77 illus., 78 illus., 89 illus.) remain to illustrate Greek skill in painting.
 - b. Roman. Roman painting, too, is lost, except for murals preserved at Pompeii (6-445 illus.) and elsewhere. They show that the art of the Augustan Age gave local colour, natural flesh tints, and rounded modelling to figures. Although Greek art was their model, it is believed that the Romans developed considerable originality in painting. Mosaic work (1-9 illus.) reached a high standard, especially in formal design, and this influenced later work.

III. EARLY CHRISTIAN PAINTING AND ILLUMINATION.

- A Roman Christian (6-33). From crude religious decorations painted by persecuted Christians on the walls of the catacombs (2-379) and later on walls of churches, a really distinct style in mural painting evolved (4-317).
- B. Byzantine (2-150; 6-33). Stiff and inexpressive but richly coloured paintings and illuminations of religious books overlaid with gorgeous conventional ornament. Byzantine

- art influenced illumination, especially in Eastern Europe.
- C. Medieval and Gothic. A period when the painter, as a rule, was an artisan using his skill in following the instructions of the clergy who ordered religious paintings and dictated costume, pose, and composition. In France (8-439), a good deal of fine painting was done, and doubtless there were artists at work all over Western Europe.
- D. Illumination (5-116). This art had great influence on European painting and must be considered with it. The Byzantine and Irish Romanosque schools first reached high standards; later came those of France (3 439; 5 199); Flanders; and England. Through miniatures (2-3), illumination influenced both portrait painting and book illustration.

IV. ITALIAN SCHOOLS.

During the Ronaissance, painting flowered in Italy (6-386) as it has done nowhere else in the world.

- A. Florentine School. These artists were the first to paint from Nature; they acquired also the mastery of perspective (6-135; 3-123) and developed technique in painting.
 - a. Early Renaissance (14th century or trecento). Cimabue (4 21, 317), a half-legendary figure, and his great pupil Giotto (4 21, 317, 6-386), who is looked upon as the founder of the Florentine School, stand at the dawn of this period. Among the greatest of the "Giottesques" was Andrea di Cione, called Orcagna (4-317); those early painters all worked in tempera or fresco (6-36).
 - b. Later Renaissance (15th, or quattrocento, and 16th, or cinquecento, centuries). Fra Angelico (4 317); Masaccio (4 317); Botticelli (2-25; 4-323 illus.; 5 67 illus.); Andrea del Castagno (4-318); Fra Filippo Lippi (5 66; 4-318); Uccello (4 317, 322 illus.); Verrocchio (4-318, 483); Ghirlandaio (4-318; 5-190); Fra Bartolommeo (f.-i.); Andrea del Sarto (6-386, 4-320 illus.): these are some of the great Florentine names before the school reaches its climax with the work of Leonardo da Vinci (4-482; 1-184 illus.; 5 47 illus.) and Michelangelo (5-190).
- B. Sienese School (4-317). This school, taking a good deal from Byzantine art, started as early as that of Florence, which it perhaps surpassed in poetry and tenderness. Early in the 15th century it had already begun to decline.
- C. Venetian School (4-318, 319). Neither the exquisite Florentine line, nor the intellectual

mysticism of Florence, but sumptuous, vibrant colour that reflected the gay and brilliant life of the Venetians marked the painting of this school.

- a. The Great Period: Carpaccio (4-318); the brothers Gentile and Giovanni Bellini (4-318, 326 illus.); Giorgione (4 318; 2-18 illus.); Titian (7-282; 6-155 illus.; 4-324 illus.); Veronese (4-319, 325 illus.); Tintoretto (4-319; 6-386).
- b. Later Masters. The Venetian was the longest lived of all Italian schools, for after its great period came a revival under Tiepolo (4-319), the greatest baroque decorator; Canaletto (4-319); and Francesco Guardi (4-319, 325 illus.), who worked till almost the end of the 18th century.
- D. Umbrian School (4 318). The heir of the Sienese School produced an art full of freshness and poetry, yet limited and childlike. Its masters were Pioro della Francesca (4-318, 319 illus.); Perugino (4-318; 6-363); and Pinturicchio (4-318).
- E. Raphael (6-363) and the Roman School (6-440). The work of Perugino's great pupil. Raphael (see illustrations: 3 520; 4-321; 5-68, 445; 6 385), was divided into three periods: Umbrian, Florentine, and Roman. At Rome he became head of a school where his successor Giulio Romano or "Jules Romain" (5-299) was an able and prolific imitator whose work marks the beginning of Italian decadence.
- F. Other Schools and Masters. In the late 15th century Padua produced a mighty genius, Mantegna (4 318), whose work had a marked influence on Venetian art; the glory of Parma was Correggio (4-320; 6 386); and many other towns produced lesser masters. The Bolognese or Eclectic School was one of incipient decadence; its masters were the Caracci (4-320; Domenichino (4-320); Guido Reni (4-320; 1-310 illus.); and Guercino (4-320). The Naturalist School was led by Caravaggio (4-320), with interest in chiaroscuro and foreshortening, and the Neapolitan landscape painter, Salvator Rosa (4-320).

V. THE NETHERLANDS AND GERMANY.

Northern artists pursued no visions of ideal beauty; they painted the world around them, and their art is influenced in manner by religion and in technique by the sister arts of illumination and miniature.

- A. Flemish School (5-38). 6 34). Minute detail, rich colour, and homely dignity characterise this art.
 - a. Early Workers. These evolved a school which rapidly became the equal of contemporary Italian work: the Van Eycks (7-380; 5-381 illus., 380 illus.), who gave oil painting new life; Memling (5-381, 382 illus.), painter of religious masterpieces; Patinir (5-381), first lagdscape artist; Roger van der Weyden (5-381), Quentin Matsys (6-34; 5-381); the Brueghels (2-97; 1-95

- illus.); and Mabuse (5-381), through whom Italian influence came in.
- b. Later Masters. Still keeping their native originality, these men profited by study in Italy: Rubens (6-463; 1-15 illus.; 5-387 illus.; 7-506 illus.), most exuberant of great masters; his pupil, Van Dyck (7-379), who with Kneller (3-259; 5-132 illus.) and other portrait painters greatly influenced English painting; Teniers (5-382, 390 illus.), who linked the Flemish with the Dutch schools.
- B. Dutch School (5-382; 6-34). Scenes of the country and of home life, fine portraits, superb still life and religious subjects; the Dutch school of marine-painters is the greatest of its type there has ever been.
 - a. Portrait Painters: Rembrandt (6-382; 5-388 illus.), a genius who excelled in whatever he touched; Frans Hals (4-121 with illus.; 5-384, 389 illus.); Terborch (5-384).
 - b. Genre Painters: The Van Ostades (5-384); Gerard Dou (5-384); Metsu (5-384); Pieter de Hooch (5-383 illus.); Jan Vermeer (7-891, 392 illus.; 5-385 illus.; 6-35), greatest of "little masters"; Jan Steen (5-384), at once jovial and a moralist; Beerstraaten (5-391 illus.).
 - c. Landscape and Animal Painters: Van Goyen (5-384); Cuyp (5-384); Ruisdael (5-384); Hobbema (5-384, 390 illus.). Paul Potter (5-384); Wouwerman (5-384).
 - d. Marine Painters: The Van de Veldes (5-384, 391 illus.); Van de Capelle (5-384); Backhuysen.
 - e. Flower and Still-life Painters : Van Huysum (5-384, 390 illus.); De Heem (5 384). Hondocoeter.
 - f. Modern: In the 19th century a Dutch landscape school arose which achieved enormous popularity; its exponents were Josef Israels (5-384); the brothers Maris (5-384); Anton Mauve. Jongkind (f.-i.), an impressionist, was of the same date.
- C. German School. Harsh realism, combined in early works with a certain religious mysticism. characterises this art.
 - a. Dürer (3-138) and Holboin (4-185). These great masters of the 16th century stand far above all others in Germany; both excelled in portraiture and religious art; both produced also fine wood engravings (8-153).
 - b. Other painters: The Cologne School, Luca-Cranach the Elder (f. i.) and his son, also Lucas; Hans Holbein the Elder (f. i.), father of more famous Hans Holbein the Younger (4-185).

VI. SPANISH, FRENCH, AND ENGLISH TO 1800.

A. Spanish School (7-112). The natural tendency of Spanish art has always been towards asceticism, and only by its greater artists is Spanish painting released from the grip of Spanish mysticism.

Noted Painters: José di Ribera (Lo Spagno letto) (7-121), a follower of the Neapolitan

Naturalist School; Zurbaran (7-112), first great Spanish master: Velazquez (7-383, 117 illus., 385 illus.; 5-115 illus.), one of world's greatest artists; Murillo (5-297; 7-112 illus.), a master of genre as of religious art; the bold and versatile Goya (4-53; 7-119 illus.); El Greco (4-70; 7-116 illus.), the Cretan-born mystic.

B. French School (3-439). For centuries painting in France was connected with the Church, then with the court. Nowhere else does the artist receive such official encouragement or find such freedom, and nowhere else does art reflect so well the country's history. The classical land-scape was a French development of the reign of Louis XIV. Then the keynote changed to frivolous gaiety and elegance, though the back-to-nature" work of Greuze and Chardin found ready appreciation.

Noted Painters: Jehan Fouquet (8-439), greatest early French artist; the brothers Le Nain (3-439, 443 illus.), portrayers of peasant life; Nicolas Poussin (8 439, 443 illus.), a very great painter; Charles Le Brun (f.-i.), court painter to Louis XIV; Claude Lorrain (3-439, 442 illus.; 6-34), the "discoverer of sunlight," who developed the classical landscape; Antoine W. ttoau (3-439, 440 illus.; 6 34), one of France's greatest masters, in whose work French elegance and vivacious charm find their first expression; Nattier (f.-i.), painter of the great ladies of Louis XV's court; Boucher (3-439, 444 illus.) and Fragonard (3-439), in whose work beauty tends toward mere prettiness; sentimental Greuze (f.-i.) and unaffected Chardin (3-439, 445 illus.; 6-34), painters of humble people; Philip de Champaigne (8-441 illus.), typical portrait painter.

- C. English School (3 258). Influenced at first by illumination, and later by Holbein and the miniature painters, later still by the Flemish portrait painters, in the 18th century English painting came into its own, chiefly as a school of portraiture, but also in landscape, especially (in early 19th century) landscape in water-colour.
 - a. Miniature painters: Nicholas Hilliard (3 258), influenced by illumination; the Olivers (8-258); John Hoskins (3-258); Samuel Cooper (8-258 illus.); Richard Cosway (3-258).
 - b. Portraiture: Lely $(f.\cdot i.; 3-259)$ and Kneller $(f.\cdot i.; 3-259; 5-132 \text{ illus.})$; Hogarth (4 184; 3-208 illus., 265 illus.; 6-137 illus.), also a great genre painter; Reynolds (6-389; 3-260 illus., 266 illus., 286 illus.); Gainsborough (3-46, 267 illus.; 6-208 illus.); Romney $(f.\cdot i.; 3-260, 259 \text{ illus.})$; Raeburn (3-260); Hoppner (3-260); Lawrence $(f.\cdot i.; 3-260)$.
 - c. Landscape: Richard Wilson (3-260, 261 illus.); J. M. W. Turner (7-837 with illus.; 3-269 illus.); John Constable (2-487; 3-268 illus.); "Old" Crome (3-260, 269 illus.).
 - d. Genre Painters. The Devis family and Zoffany (1-311 illus.), founder of the "con-

versation piece"; Morland (8-264); Wheatley (3-264); Stubbs (f.-i.; 3-273).

e. Water-colour School. The English school is pre-eminent in this branch of painting, whose development is traced from Paul Sandby (3-261) and Girtin (3-261, 271 illus.) through the Cozens (3-261) family to J. S. Cotman (2-515; 3-261 illus.); De Wint (3-262); and David Cox (3-262). Great oil-painters who also did fine work in this medium are Turner (7-337) and Constable (2-487). Here, too, comes William Blake (1-482).

VII. MODERN PAINTING

In the 19th century France assumed the position of teacher in the graphic fine arts that had been held earlier by Italy. Many movements in painting have radiated from Paris, though England claims a notable school of landscape painting headed by Constable (2 487) and Turner (7-337), and the Pre-Raphaelite movement (6-283) was born and died there. In France, revolutionary classicism was tollowed by Romanticism and that by the Barbizon School (3-440; 2-512), after which a number of movements were on foot at the same time.

A. In France.

- a. Classicism, which coincided with Napoleon:
 David (3 439, 444 illus.) and Ingres (3-440;
 5 47 illus., 505 illus.) were its great exponents.
- b. Romanticism, a reaction led by Géricault (f.-1.) and Delacroix (8-440).
- c. The Barbizon School (3 440; 2-512), led by Corot (2 512) and J. F. Millet (5-208; 3 446 illus.); a minor group followed Courbet (3-440).
- d. Impressionism (4-236; 3-440; 6-34). This almost world-wide movement began with the work of Claude Monet (f.-i.; 3-440, 447 illus.; 4-237, 236 illus.); the group also included Édouard Manet (f.-i.; 3-440; 4-237); Degas (3-449; 1-352); Renoir (4-237; 3-449, 448 illus.); Pissarro (3-449; 4-237) in France; in Germany, Liebermann (f.-i.); Slevogt; and Corinth; in Spain, Sorolla (f.-i.) and, to a certam extent, Zuloaga (7-121, 120 illus.).
- e. The Post-Impressionists (6-270). Having comparatively little in common, these painters continued to rebel against academic art and laid the foundations for later groups. Gauguin (f.-i.; 8-449); Van Gogh (7-881; 8-449); and Cézanne (2-298; 8-447 illus.) were leading figures.
- f. Later Groups. Matisse (f.-i.; 3-449); Braque (3-449); Rouault (f.-i.; 3-449); and Picasso (7-121; 3-449, 124 illus.), greatest of modern masters, each had followers. The first of these was concerned with new scales of colour and pattern, and founded the "Fauvist" school (3-449); the second with a strange type of picture derived from stilllife; the fourth, great above all as a draughtsman, remains a ceaseless experimenter. To Picasso, with Cézanne (2-298; 3-447 illus.),

was due Cubism. German Expressionism (f.-i.) was a revolt against Impressionism (4-236). Futurism (4-320), an Italian manner; and Surrealism (f.-i.; 3-449) were short lived.

B. In England.

- a. Portraiture. Fine portraiture continued, Alfred Stevens (6-524), and G. F. Watts (8-262; 6-6 illus.; 7-11 illus.) being outstanding in the mid-19th century; later came the American, Sargent (8-264); Orpen (f.-i.; 8-262); McEvoy (f.-i.), and others.
- b. Subject Pictures. These achieved in Victorian England perhaps a greater popularity than ever before. William Frith (8-264, 263 illus.) with his enormous canvases full of life, and the Pre-Raphaelite Brotherhood (6-283), led by Rossetti (6-285; 3-264); Holman Hunt (6 285, 284 illus.; 3 264; 4-367 illus.); and Millais (5 207, 208 illus., 138 illus.; 2-243 illus.; 4-201 illus.; 3-270 illus.), represented two very different approaches to this type of picture. Burne-Jones (3 264; 5-266; 6-285); Ford Madox Brown (f-i., 8-264 illus.); Watts (3-262; 6-6 illus.; 7-11); and Lord Leighton (3-273, 124 illus.) were other successful painters of subject pictures.
- c. Impressionism, Surrealism. After the representational art of the 19th century came an Anglicised Impressionism, whose chief exponents were Whistler (3-262 with illus.); Sickert (4-237; 3-263); Wilson Steer (3-263, 271 illus.; 4-237); Tonks (f.-i.); and members of the Camden Town and London Groups (f.-i.) such as Harold Gilman and Charles Ginner, Henry Lamb and Duncan Grant (f.-i.).
- d. Other Artists. William Etty (8-264) is reckoned a fine painter of the nude; Landseer (3-264, 263 illus.; 1-93 illus.) of animals. Twentieth century artists include Augustus John (8-263, 272 illus.), excelling as portrait painter; Paul Nash (8-262); Stanley Spencer (f.-i.; 8-273 with illus.); Graham Sutherland (8-262, 260 illus.).

VIII. ORIENTAL PAINTING.

The paintings of the East have proved even more perishable than those of the West, for they were executed in water-colours on silk or paper or parchment, sometimes, in India and Persia, embellished with a good deal of gold.

- A. China (2-363, 373 illus.; 6-37). Chinese literature as far back as the Han dynasty (206 B.C.-A.D. 221) makes frequent reference to paintings, but no examples of work earlier than about A.D. 400 are known to exist. Landscape, real or imaginary, is the favourite subject, with trees and flowers coming next. Indigenous Chinese art never developed portrait painting in the Western manner, although appropriate figures often appear in landscapes, in domestic scenes, and in illustrations of moral procepts and legends.
- B. Japan (4-352). Japanese painting, like the other Japanese arts, including writing, is derived from the Chinese, and developed much later—from about the eighth century A.D. Landscape, especially representations of the sacred mountain Fujiyama (4 341, 346 illus.), flowers, and birds are usual subjects, but portrait figures are also common. The Japanese excel in the colour print (8-153).
- C. Persia. Persian painting, with its delicacy and brilliance, is akin to the art of the Western illuminator and miniaturist rather than that of the painter in oils. Formalised flower gardens; groups of veiled ladies; warriors in colourful turbans and gorgeous attire, wielding mighty bows and bestriding spirited horses: these are the subjects of the artists who flourished in the 15th to 17th centuries A.D.
- D. India (4 249). Besides miniature-style paintings in the Persian manner of formal gardens jewelled with flowers and of ladies in flowing saris (17th and 18th centuries), India has paintings of a much earlier date in the frescoos of the caves of Ajanta (4-248 illus.).

The rise of Islam, which forbids the representation of the human likeness in any medium, and its spread throughout western Asia and into northern India, stultified the development of all painting in areas where that faith became dominant.

Interest-Questions in Painting

Which Spanish artist was appointed court painter to Philip IV at the age of 24? 7-384.

Who painted the series of pictures called Marriage & la Mode? 4-185 illus.

Who were the great animal painters of pre-history? 6-33.

Where were a number of the first Christian paintings made? 6-33.

Which Italian artist painted "Mona Lina," and where is this gloture to be seen? 4-482 illus.

Which French painter was called "the founder of modern art"? 3-439.

Who painted a selebrated series of notabilities at the court of Henry VIII? 4-186.

Which European country is said to have produced more "old masters" than any other? 4-317.

To whom can be attributed the cidest known oil paintings? 5-381. Which painter's followers were called Giotteschi? 4-317.

Which artist is reputed to have painted 36 portraits of Charles 1 3 5-382.

Who painted a famous freeco of "The Last Juligment," and where is this masterpiece to be seen? 4-35°°

What is a fresco? 6-36.

When did Byzantine art reach its maturity? 6-38.

Who among the Venetian eclourists of the 16th sentury stands unrivalled? 7-283.

To what group of painters did Dante Gabriel Expectil belong 6-284.

Who invented oil-painting? 6-36.

Who was the first British landscape painter to achieve renown o' the Continent? 3-260.

Who was the first president of the Royal Academy? 3-259. Which French impressionist painter is famous for his pictures belief dancers? 3-449.

What was El Greeo's real name? 4-70.

PHYSICS

THE scope of modern physics and its relations with other branches of science are indicated in the main article on the subject (6-185). It deals with the inanimate aspects of Nature as distinct from living organisms, dealt with by biological sciences. But the distinction between physical and biological science is not sharp, and such studies as biophysics and biochemistry occupy a boundary position.

I. GENERAL PROPERTIES OF MATTER.

- A. Mass. Fundamental property of all material objects, corresponding to the simple notion of the amount of matter which they contain (6-185. See also Mechanics outline, 8-176.)
- B. Volume or Extension. Also a fundamental property, corresponding to the simple notion of the amount of space which objects occupy.
- C. Density. The mass per unit volume, corresponding to the simple notion of how tightly matter is packed in a substance. Densities are now quoted in grains per cubic centimetre or more accurately in grains per millilitre (6-185).

Relative Density or Specific Gravity (S.G.) is the ratio between the density of a substance and that of some standard substance—usually hydrogen (at 0° C. and atmospheric pressure) for gases and vapours, and water at 4° C. for solids and liquids. Since the density of water at 4° C. is 1 gm. per ml. the S.G. of solids and liquids is numerically the same as the density.

D. Elasticity. The extent to which a substance tends to return to its original shape after being deformed.

Stress and Strain. The measure of the deformation is called the strain. The force producing it is called the stress.

Elastic Limit. Maximum amount of stress or strain beyond which material yields and no longer returns to its original shape. (Sometimes used for the point beyond which strain is no longer proportional to stress.)

Measures of Elasticity. Young's modulus gives the relation between a squeezing or a stretching force and the change of length it produces; the bulk modulus gives the relation between a compressing or an expanding force and the change in volume it produces; the rigidity modulus gives the relation between a twisting or shearing force and the change in shape it produces.

- E. Viscosity. The tendency of a fluid to resist the motion of one layer relative to the next. Viscosities of liquids can be calculated from their rate of flow through narrow tubes, or from the speed at which small spheres of known weight and side fall freely through them. The unit is the poise, equal to one dyne second per sq. cm. Viscosity in liquids decreases with increased temperature; in gases it increases.
- F. Hardness, Malleability, Ductility. These properties are chiefly important in metallurgy. A rough indication of relative hardness is given by Mohs' Scale, based on a series of substances each of which will scratch the one before.

Similar scratching tests serve to place any given substance in the series. Quantitative measures depend on how deeply a small sphere (Brinell, scale) or pyramid (Tukon scale) of known dimensions will dent the material under a given load.

II. STATES OF MATTER.

- A Solid. A solid has a definite mass, a definite volume, and a definite shape. All true solids are either single crystals or collections of crystals (sometimes very numerous and microscopic in size) all stuck together (3-6).
 - Crystal Structure. In a crystal the atoms are all arranged in a definite, regular, and more or less rigid order in space (3.5). Many of the physical properties of different materials can be explained by their crystal structure; e.g. alloys (1-114) and plastics (2-321).
- B. Liquid. A liquid has a definite mass, a definite volume, but no definite shape. Liquids strongly resist any change in bulk, but offer no permanent resistance to shearing lorces. Attempts to explain this behaviour on the basis of kinetic theory have not been entirely successful; but it is clear that the atoms are in some way still partially organized in space (4-520).
- C. Gas. A gas has a definite mass, but no definite volume or shape.
 - Cas Laws. For any given mass of gas the volume, v, varies inversely with the pressure, p, if the temperature is constant (Boyle's law); and directly with the absolute (Kelvin) temperature, T, if the pressure is constant (Charles's law). These are combined in the expression pv = RT, where R is the gas constant, and is equal to 83,145,000 erg per degree per mole. These laws would apply exactly only to an ideal gas whose molecules had no size at all and exercised no attraction on each other however closely they approached. The behaviour of actual gases is represented more closely by van der Waals' equation: $(p+a/v^2)(v-b)=RT$, where a takes account of the mutual attraction of the molecules, and b is proportional to their volume (8-508).
- O. Colloids. Systems in which one substance (called the disperse phase) is scattered in the form of very small partieles (of which one dimension at least is between about 1/1,000 and 1/1,000,000 mm.) through another substance (the dispersion medium). Systems in which solid particles are dispersed in solids, however, are not usually called colloids; whoreas some substances which have molecules of colloidal size exhibit colloidal properties without being dispersed through another medium (2 455).

PHYSICS

MECHANICS

The whole of mechanics is based on Newton's three laws of motion (5-159). From these a complete system can be built up relating the motion of bodies to their masses and the forces acting on them. In the basic theory the effects of friction (8-470) are neglected.

- A. Units. These are based on three fundamental units, usually of length, mass, and time. Three common systems are: the centimetre-gramsecond (C.G.S.) system used in scientific work, the metre-kilogram-second (M.K.S.) system of practical units used in technology, and the foot-pound-second (F.P.S.) system used in engineering.
 - a. Mass. This is measured by "weighing" in a balance against standard masses (usually called "weights") which have themselves been checked directly or indirectly with the international prototype kilogram in Paris or the imperial standard pound in London (6 185). The units are the gram, kilogram (1,000 grams), and pound.

Note In spite of the names of the units and the method of measuring, mass, representing "quantity of matter," should be clearly distinguished from weight, which is the force with which any given mass is attracted to the earth by gravity.

- b. Speed, Acceleration. Uniform speed in a straight line, or instantaneous speed, is measured in contimetres, metres, or feet per second. If the speed increases or decreases, the moving object is said to undergo an acceleration (positive or negative). If in the course of one second the speed increases by one centimetre per second, then the acceleration is I cm. per sec. per sec. Similarly for I metre per sec. per sec., and I ft. per sec. per sec.
- c. Force. Anything that imparts an acceleration to a mass is called a force. Units: the dyne, which gives a mass of 1 gm. an acceleration of 1 cm. per sec. per soc.; the newton (100,000 dyne), which gives 1 kg. an acceleration of 1 metro per sec. per sec.; the poundal, which gives 1 lb. an acceleration of 1 ft. per sec. per sec. (Note that since the acceleration due to gravity at the earth's surface is approximately 32 ft. per sec. per sec., 1 lb. wt. is equal to 32 poundals.)
- d. Work, Energy. Work is the product of a force and the distance through which it acts. Units: the erg, work done by a force of 1 dyne acting through 1 cm; the joule (10,000,000 erg), work done by 1 newton acting through 1 metre; the foot-poundal, work done by 1 poundal acting through 1 ft. (In engineering the unit is the ft. lb., equal to 32 ft. poundals.) Energy is the ability to perform work and is measured in the same units (3-245).
- e. Power. Rate at which work is done. Units: the erg per second; the watt, equal to I joule per sec.; the horsepower, equal to

- 550 ft. lb. per sec. or 746 watt. (The kilowatthour or Kelvin, by which electricity is usually sold to the public, is a unit of energy representing the work done when a power of 1,000 watt is maintained for 1 hour. It is thus equal to 3,600,000 joule.)
- B. Statics. Branch of mechanics which deals with forces in equilibrium, i.e., so balanced that they produce no motion.
 - a. Polygon of Forces. If two or more forces acting at a point are in equilibrium, they can be represented in magnitude and direction by successive sides of a polygon.
 - b. Parellelogram of Forces. If two forces acting at a point are represented in magnitude and direction by adjacent sides of a parallelogram, they will be together equivalent to a third (the resultant) represented by the diagonal of the parallelogram (5–156).

Note: Forces and velocities are called vector quantities because in order to define them completely it is necessary to specify their direction as well as their size. The parallelogram is a graphic method of compounding two forces or velocities which gives the same results as addition in vector algebra.

- c. Resolution of Forces. Any single force can be considered as equivalent to two separate forces represented by two sides of a parallelogram of which it forms the diagonal. Usually a single force is resolved into two components at right angles to each other, or (in three dimensions) into three components in mutually perpendicular directions (5–156).
- d. Machines. A machine is a contrivance that enables a force applied at a given point to do work conveniently. Thus a small force acting through a large distance may be made to raise a large weight through a small distance. The six simple machines are: the lever, the pulley, the inclined plane, the wedge, the screw, the wheel and axle (5-157). Similar results can be obtained by hydraulic devices (4 214).
- C. Dynamics deals with moving bodies.
 - a. Kinematics deals with the motion only without taking account of the forces producing it. If u is the initial speed of a body; its speed after t seconds; a its acceleration and s the total distance covered, then:

$$v = u + at$$

$$s = \frac{1}{2}(u + v) t$$

$$s = ut + \frac{1}{2}at^{2} = vt - \frac{1}{2}a^{2}$$

$$v^{2} - u^{2} + 2as$$

From these formulae it can be shown that the path of any projectile thrown or shot into the air will be a parabola, while the path of a stone dropped from an aeroplane will be half a parabola (5-57), provided that in both instances air friction is neglected.

b. Kinetics deals with the relations between motion and the forces producing it. A particle is defined as a body possessing mass.

but so small in size compared with the distances over which it moves that it can be considered as virtually a point.

- 1. Momentum. Product of mass and speed. M-mv. The principle of the conservation of momentum states that in any system of mutually attracting or impinging particles, the total linear momentum in any fixed direction remains unaltered unless there is an outside force acting in that direction.
- 2. Energy. The energy of a particle may be of two kinds:

Kinetic Energy, which it has by virtue of its motion. Kinetic energy E_k - $\frac{1}{2}mv^2$.

Potential Energy, which it has by virtue of its position. If it is raised to a height h then its potential energy $E_{\rm p} = mgh$, where g is the acceleration due to gravity.

If a body rused to a height \hat{h} then falls through that distance, its velocity at the bottom will be given by

 $v^2 - u^2 + 2 as - 0^2 + 2gh - 2gh$.

Its kinetic energy will therefore be given by

$$\begin{array}{ccc} E_k & \frac{1}{2}mv^2 & \frac{1}{2}m(2gh) \\ & mgh. \end{array}$$

Thus potential and kinetic energy are interchangeable without loss and without gain. This is a simple example of the principle called conservation of energy.

- 3. Centrifugal Force. This acts outwards whenever a particle is constrained to move in a circle (2 293). If the radius of the circle is r the centrifugal force is $mv^2 r$.
- c. Rigid Bodies. These are considered as collections of particles whose mutual positions remain invariable.
 - 1. Centre of Gravity. In every position of a rigid body the force of gravity acting on the body appears to act in a direction passing through one particular point called the centre of gravity (5–157).
 - 2. Stable and Unstable Equilibrium. If when the body is slightly displaced the forces acting on it tend to bring it back to its original position, the body is in stable equilibrium; if they tend to increase the displacement, it is in unstable equilibrium (5–156).
 - 3. Rotation. This form of motion is measured in angular measure (degrees, radians, or revolutions) per second (or per minute, etc.).
 - 4. Torque. Two equal and parallel forces acting in opposite directions so as to produce turning are called a couple. The torque or amount of the couple is the product of one of the forces and the perpendicular distance between them.
 - 5. Moment of Inertia. For a single particle, this is a product of its mass and its distance from the axis of rotation. For a whole body it is the sum of these products for all the separate particles. Finding such a sum is a problem in the integral calculus.

Results for simple geometrical torms are: Solid sphere rotating about a diameter, $2mr^2/5$.

Flat disc rotating about one diameter, mr^2 4.

Cylinder rotating about its axis, mi2 2.

Thus rod rotating about a line perpendicular to its length passing through centre $ml^2/12$; through one end, $ml^2/3$.

The kinetic energy of a rotating body is given by $E_{\mathbf{k}} = \frac{1}{2}\omega^2 I$, where ω is its angular velocity (in radians per second) and I its moment of inertia.

D. Field Theories.

a. Newtonian Theory of Gravitation. Any two particles of matter will attract each other with a force proportional to the product of their masses and inversely proportional to the square of their distance apart (4-66). On the basis of this one law it can be shown (among other things) that the path of a planet round its sun will be an ellipse with the sun at one focus (7-188); that any two bodies falling from the same (increasing) speed whatever their weight or shape (4-66); that the path of a projectile fired at any angle above the horizon would (but for friction and the curvature of the earth) be a parabola.

the earth) be a parabola.

The effects of gravity are indistinguishable from the effects of any other form of continuous acceleration, e.g. centrifugal force (2 203).

- b. Relativity. The Newtonan system is based on the assumption that some one frame of reference in the universe can be taken as being at rest, e.g. the other (3 302). Einstein denied this assumption, and modified Newton's equations slightly, first so that they would remain the same for all observers who were moving uniformly relative to each other (Special Theory of Relativity); then for all observers even though their relative motion was accelerated (General Theory of Relativity). The difference is observable only when dealing with very great distances or very high speeds (6 380).
- c. Unified Field Theory. Einstein's later attempt to include electric and magnetic forces with gravitation under one set of equations is apparently not susceptible of experimental proof.
- . Hydrostatics deals with conditions of equilibrium in fluids.
 - a. Pressure. At any point in a fluid the pressure is the same in all directions. It is measured as the force pressing on unit area, in dynes per sq. cm., or lb. per sq. in. (Here lb. is the pound-weight, and hence a unit of force.) Pressure in gases is often measured in terms of the number of inches or millunetres of mercury (ins. or mm. Hg) which it will support.

Average atmospheric pressure at sea level, measured by a barometer, is equal to about 29.9 ins. Hg, 760 mm. Hg, 14.7 lb. per sq. in., or just over 1 million dynes per sq. cm. For this reason an international unit of pressure,

the bar, equal to 1,000,000 dynes per sq. cm., has been agreed.

1 bar = 1,000 millibars = 750.07 mm. Hg;

1,016 mb. = 30 ins. Hg. (1-370).

If a liquid has a free surface, the pressure at any point P below it is equal to the pressure on the surface (usually the atmospheric pressure) plus the weight of a column of the liquid of unit cross section extending vertically from the surface to the level of P. Hence the rapid increase of pressure with depth at sea

Pressure applied at any one point is transmitted uniformly throughout the liquid. This is the principle of the hydraulic press and the hydraulic jack. It also accounts for the tendency of all liquids to "find their own level," and for the working of the siphon.

b. Principle of Archimedes. If a body is immersed in a liquid, its apparent loss in weight is equal to the weight of the liquid displaced. This is the principle of the hydrometer and can be used for finding the density either of a solid or of a liquid (4-222). The total weight of a floating body is equal

to the weight of the liquid displaced.

- F. Hydrodynamics deals with fluids in motion. As a first approximation the theory is worked out for a "perfect fluid." i.e., a fluid which is perfect fluid," i.e., a fluid which is completely incompressible and offers no resistance at all to distorting forces.
 - a. Types of Fluid Motion. Steady motion is such that at any given point the direction and speed of movement remain constant. Turbulent motion has a certain amount of irregular

movement (usually in the form of eddies) superimposed on the general motion. Cavitation occurs when the continuity of the liquid is broken and gaps (which may be extremely small) are formed in the body of the liquid. This happens only with very violent motion (e.g. round ships propellers when they are run too fast). In the absence of cavitation, the motion is said to be continuous.

b. Streamline. Any imaginary line in a steadily moving fluid such that at any point on it the particles of the fluid are moving

along that line.

c. Equation of Continuity. In a fluid flowing steadily in a tube, or through any system where no particles of the fluid cross the boundaries in either direction, the average speed in any part is inversely proportional to the area of the cross section.

d. Bernouilli's Theorem. In a stream flowing horizontally through any such system the pressure will be least where the speed of flow is greatest.

Note. The whole of mechanics is sometimes classified as a branch of applied mathematics

rather than of physics.

G. Hydraulics is the branch of engineering that deals with the application of hydrostatics and hydrodynamics to practical purposes. It is chiefly concerned with the behaviour of water and oil when confined to pipes and channels (4 214.)

Aerodynamics is similarly concerned with the application of hydrodynamics to the practical problems of flight (1-31).

HEAT

Kinetic Theory. The sensation of heat results from movements of the molecules of which a substance is composed (4-145). Gas molecules move in straight lines until they collide either with each other or with other substances, e.g. the walls of their container. Molecules in a solid vibrate around a fixed position. Liquid molecules also vibrate about a mean position, but that is not necessarily fixed and may move relatively to the rest of the liquid and to neighbouring solids, e.g. when the liquid flows (4 520). The explanation of thermal phenomena on the basis of molecular motion is called the kinetic theory (3-508), and the branch of mathematics used to find out the combined effect of very. large numbers of individual movements is statistics (5 148).

Temperature. The physical property corresponding to our sensation of how hot or how cold a body may be. It is found to correspond also to the average speed with which the molecules of a substance are moving (4-146).

Expansion. Most solids and liquids expand slightly with increased temperature, the faster vibrations of the molecules requiring (so to speak) more elbow-room. The coefficient of linear (bulk) expansion is the ratio of the extra length (volume) produced by a rise of one degree in temperature to the original length (volume) Exceptions to the rule of expansion are: water between 0° C. and 3.8° C., which contractslightly, and a special alloy invar (64% iron, 76% nickel with traces of other metals) which hardly changes in size at all (5-432).

The rule for the expansion of gases was first stated in the form of Charles's law (called Mariotte's law in France): the volume of a given mass of any gas at constant pressure increases by 1/173 of its volume at 0° C. for every degree by which its temperature is raised This is now combined with Boyle's law in the more general gas laws represented by the formula pv = RT.

Measurement of Temperature. Ordinary thermometers measure temperature by the expansion of mercury in glass or of alcohol in glass (7-267) The gas thermometer measures the expansion of a gas (usually hydrogen) under constant pressure; this is more uniform than the ex pansion of liquids. Temperature can also be measured by electrical effects, such as the change ir resistance of certain substances " different temperatures (platinum resistance thermometers), or the thermo-electric currentproduced (thermo-couples). Very high tem peratures are measured by the strength or colour of the light emitted (optical pyrometers)

Temperature Scales. Common practical scales are Centigrade, Fahrenheit, and Reaumur (7-267). The absolute, thermodynamic, or Kelvin scale is theoretically independent of any particular substance used in a thermometer. The degrees are approximately equal to those in the centigrade scale, and correspond closely to those registered by a gas thermometer.

Zero on the Kelvin scale is that temperature (-273·16° C.) at which, theoretically, the molecules of a substance would have no movement at all. It can never be attained in practice, though temperatures down to 0·01° K. have been attained in special apparatus.

Other points on the Kelvin scale were agreed

internationally in 1948 as follows:

Boiling point of liquid oxygen 90·19°K. -- 182·97°C. Melting point of 273·16°K. 0°C. ice Boiling point of 373·16°K. 100°C. water Boiling point of sulphur 717.76°K. 444.6°C. Melting point of 1233.96°K. silver 960.8°C. Melting point of gold 1336·16°K. 1063 O°C.

Quantity of Heat. Ins corresponds to the kinetic energy of the moving molecules (4-148). Units: the calorie or gram-calorie, being the amount of heat required to raise the temperature of one gram of water by one degree centigrade (since this varies slightly with temperature, it may be necessary to specify the 15° calorie which will raise the temperature of one grain of water from 141° to 151° C., or the mean calorie, 100 of which will ruise the temperature of I gram of water from 0° to 100° ('.); the Calorie or kilocalorie (used in physiology), equal to 1,000 gram-calories; the British thormal unit (B.Th.U.), defined as 1/180 of the amount of heat required to raise the temperature of 1 lb. water from 32° (melting-point) to 212° F. (boiling-point).

The measurement of quantities of heat is called calorimetry, and the instruments used for the purpose are called calorimeters.

Production of Heat. Heat is produced in various ways: e.g. by chemical reactions, notably burning (2-323); by friction (3 470), by electric currents (4 147); by radio-activity and other atomic processes (1 299).

Transfer of Heat. This can be by three methods; conduction, convection, and radiation (4-147).

Mechanical Equivalent of Heat. This was first-measured by Joule, using apparatus in which water was heated by the rotation of paddles (2 325). Modern methods, using electrical currents, make the 15° gram-calorie equivalent to 41.852 million ergs of energy.

Specific Heat. Amount of heat required to raise 1 gm. of a substance through 1° C. Specific heat varies to some extent with temperature.

Dulong & Petit's Law. The product of the specific heat and the atomic weight (called the atomic heat) of any solid element will be approximately 6.4 (in practice there are many exceptions to this rule, some of which are explained by quantum theory).

Latent Heat. Heat absorbed without change of temperature when a solid changes to liquid (latent heat of fusion), or when a liquid changes to a vapour (latent heat of evaporation). When the vapour condenses or the liquid freezes an equivalent quantity of heat is given out. The latent heat of steam at 100° C, is about 54° cal. per gm. (970 B.Th.U. per lb.); of ice at 0° C, about 80 cal. per gm.

Thermodynamics. Science dealing with the mathematical relations between heat and work (4-148). Developed first in the 19th century in order to calculate the efficiency of steam engines. Later applied to other heat engines (e.g. internal combustion engines, gas turbines) and other forms of energy conversion (e.g. chomical reactions, thermo-electricity, atomic disintegration).

SOUND

Sound is a form of wave motion, consisting of longitudinal or compression waves which can travel not only in air but in any elastic medium.

A. CHARACTERISTICS OF SOUNDS.

a. Notes and Noises. In musical notes the wave motion is comparatively regular and the wave forms repeat themselves fairly accurately a certain number of times a second. That number is called the frequency. The length of the repeated wave form is called the wavelength of the wavelength multiplied by the frequency gives the distance which the wave travels in a second, i.e. the velocity (7-86).

Noises are produced when the wave forms show no such regularity.

b. Pitch. Whether a note sounds high or low depends on the frequency. The human ear when young can hear from about 20 c/s to 20,000 c/s. Vibrations above this frequency are called ultrasonic (7-843).

c. Loudness; Intensity. This depends on the energy carried by the wave, the speed with which the air particles move, or the amplitude of the displacement (7-86). The ear, however, judges loudness to increuse in successive steps as the energy per sq. cm. is repeatedly doubled, to that scales for the measurement of loudness and sound intensity are usually logarithmic.

1. Bel, Decibel. Units of difference in sound

1. Bel, Decibel. Units of difference in sound intensity. A decibel represents the smallest difference in intensity that a normal our can

detect at about 1,000 c/s.

2. Phon. Unit of loudness. Since apparent loudness varies considerably with pitch, the sound to be measured is matched with a pure tone at 1,000 c/s. The loudness in phons is then equal to the number of decibels in this reference tone above an arbitrary zero of 10^{-16} watt per sq. cm.

d. Timbre. This is the quality of the sound. by which a violin can be distinguished from a tin whistle or the voice of one person from another. It depends on the number of upper partials present as well as the fundamental note sounded (7-86).

B. SOURCES OF SOUND.

- a. Strings. These can be plucked, struck with a hammer, or bowed. The frequency of the note varies inversely with the length of the string, directly with the square root of the tension.
- b. Air Columns. These are set vibrating by reeds, lips, or edge tones. The frequency varies inversely with the length of the tube or pipe. Stopped tubes (i.e. tubes closed at one end) sound an octave below open tubes.
- c. Tongues and Reeds. The note depends on the elasticity of the material, its length, and its weight. If the elasticity is very weak the vibration may accommodate itself to the frequency of an attached column of air (e.g. clarionets). In tuning-forks, however, where the elasticity is high, the tone is very pure, and the instrument forms the most convenient standard of puch (7-87).
- d. Plates. The vibration of these may be complicated, as shown by Chladni figures (7-86).
- e. Bells. Even more complicated than plates. Partials are often louder than fundamentals and include sharp discords (1 424).
- f. Sirens. Here the sound is produced by puffs of air or steam which pass through a revolving wheel (7–87).

C. BEHAVIOUR OF SOUND WAVES.

- a. Reflection. Sound is reflected from smooth surfaces. Echoes are sounds reflected back from walls, cliffs, etc. (3 156). Walls of concert halls, broadcasting studios, etc., often have to have their surfaces broken up to reduce echo. The time taken for echoes to return under water forms the basis of echo sounding (6 337).
- b. Refraction. Sound is refracted like light (4-498) when it passes from one medium to another, e.g. from warm air to cold, or in and out of fog.
- c. Forced Vibrations. One vibrating body will often set another in vibration: e.g. a tuning fork pressed on the surface of a table. This

phenomenon is used to increase the sounds given off by strings in many musical instruments.

- d. Resonance. If the natural frequency of vibration in the second body is the same as the frequency imposed (or a simple multiple of it), the two will reinforce each other. In the same way a sound can set a body vibrating in sympathy. Both effects are called resonance (7-87).
- e. Interference. Where the troughs of one train of sound waves arrive at the same time as the crests of another train at the same frequency, interference occurs and the sound fades. The principle is the same as for interference in light (4-500).
- f. Beats. When two notes of nearly equal frequency are superimposed, periods of interference alternate with periods of reinforcement, producing the beats characteristic of discords and notes out of tune in music.
- g. Velocity of Sound. In any fluid the velocity of sound, v_r is given by $v = \sqrt{(E/\rho)}$ where D is the elasticity of the medium and ρ the density.

Since the elasticity of a gas varies directly with its density, and the density with the pressure, the velocity of sound in any gas is not affected by the pressure. On the other hand, it is affected by temperature, and because the temperature of the atmosphere decreases with height above sea level, the velocity of sound decreases (7-87).

D. RECORDING AND REPRODUCTION.

- a. Gramophone Records. In Edison's original system, the sound waves were represented by hills and valleys at the bottom of a groove running spirally round a wax cylinder. In later gramophone records they are represented by side-to-side displacements in a groove cut spirally on a disc.
- b. Film. The waves are represented by variations in the extent to which the sound-track obscures the transparency of the film There are two kinds, variable width and variable density.
- c. Tape. The waves are represented by variations in the magnetisation of a special magnetic tape or wire (7-87).

LIGHT

Light is made up of electromagnetic waves, with wavelengths from about 3,800 angstroms to about 7,600 angstroms (8-221).

I. HISTORICAL.

Newton held that light consisted of innumerable small flying particles or corpuscles; Huygens, that it was a form of wave-motion (4-500). In the nineteenth century the theory of a luminiferous ether was developed (3-302). Clerk Maxwell (5-149) showed mathematically that electromagnetic waves should occur in certain circumstances, and if produced that they would have the same speed as light.

II. GEOMETRICAL OPTICS,

This branch of the subject is concerned with tracking the paths of light rays through various arrangements of mirrors, prisms, lenses, etc. For this purpose the wave nature of light is virtually disregarded, and it is considered simply as a series of rays travelling in straight lines.

A. Reflection. When a ray is reflected, the angle of reflection is equal to the angle of incidence and both rie in the same plane (4-498).

Images formed by reflection in convex concave, and plane mirrors (5-523).

Internal reflection and the use of prisms instead of plane mirrors (4-500).

- B. Refraction. When a ray passes from one medium to another, it is bent so that its path hea closer to the normal in the denser medium (4-498).
 - Snell's Law: For any two given media, the ratio of the sine of the angle of incidence to the sine of the angle of refraction is constant. If the first medium is a vacuum (or in practice air), this ratio is the refractive index of the second medium. It is equal to the ratio of the speeds of light in the two media.
- C. Lenses. There are various kinds of spherical lenses: double convex, double concave, planoconvex, plano-concave (4-481); also meniscus lenses with one face concave and the other convex, and astigmatic lenses with at least one surface cylindrical.
 - a. Converging and Diverging Lenses. A converging lens (e.g. a double-convex lens) makes parallel rays converge so that they all pass through a single point called the focus. A diverging lens (e.g. a double-coneave lens) makes parallel rays diverge so that they all appear to have come from a single point, also called the focus (5 522).
 - b. Focal Length; Power. The distance from lens to fogus is called the focal length or focal distance (4 481). The reciprocal of the focal length in metres gives the power of the lens in diopters.
 - c. Real and Virtual Images. The image formed by a lens is called real if the light rays actually pass through it; virtual if they appear to come from it without having in fact passed through it. There are two methods of working out the size, position, and nature of images: by plotting the tracks of key rays geometrically, or by applying algebraic formulae (5-522).
 - d. Defects of the Image. For various reasons, the images formed by ordinary spherical lenses are not perfect. The chief defects are: spherical aberration, astigmatism, coma, field curvature, burrel and pineushion distortion, and chromatic aberration. Most of these can be corrected to a considerable extent by fitting together anything up to seven separato lenses made of different kinds of glass (4-482).
- D: Optical Instruments. Those based chiefly on the principles of geometrical optics include: macroscopes (5-194); telescopes (7-248); cameras (6-171); projectors (2-392); lighthouses (4-502); kaleidoscopes (4-391); stereoscopes (7-155).

III. PHYSICAL OPTICS.

I'ms branch of the subject is concerned with the velocity of light, its energy relations, and the effects of its wave structure.

A. Velocity of Light. This was first estimated by Roemer from the time taken by light from Saturn's moons to cross the Earth's orbit. It was measured with a rotating wheel by Fizeau in France in the mid-19th century (4-498); later and more accurately by Michelson in America using rotating mirrors,

A later determination, made by Dr. L. Essen at the National Physical Laboratory, England, in 1947 and 1950, using a radar resonance tube, gives the value as 299,784 Km. (486,282 miles) per sec. For many practical purposes (e.g. translating radio wavelengths into frequencies) the approximation 3×10^{10} cm. per sec. is sufficiently exact.

B. Diffraction and Interference. Light, like other, forms of wave motion, spills round the edge of intervening obstacles; but because light waves are very short the effects of diffraction are visible on only a small scale.

If, with two trains of light waves of approximately the same wavelength, the crests of one train coincide with the troughs of another, the two cancel each other out, leaving darkness. This is called interference. If crests coincide with crests and troughs with troughs, the two trains reinforce one another.

A combination of diffraction and interference leads to such phenomena as interference fringes, Newton's rings, iridescence (i.e. colours of thin films). It is utilized in the instrument called the interferometer (4 500).

Interference also sets the limit to the small ness of the objects which a microscope will reveal clearly, or the closeness of celestral objects which a telescope can show as separate stars.

C. Production of Light.

- a. Incandescence. All substances above a certain temperature begin to glow first red hot, eventually white hot. At the immense temperatures found in the sun and other stars not only ultra-violet but even X-rays are given off (6 339).
- b. Black Body Radiation. Bodies which are black absorb most light at low temperatures and are the most efficient radiators at high temperatures. The closest approximation to perfect "black body" radiation is found in the radiation from a small hole bored into an otherwise completely enclosed cavity (6 317.)
- c. Photons. It was because the wavelengths in such cavity radiation did not correspond with classical theory that Max Planck suggested that the light might be made up in bundles or pellets, now called photons. The size of these is given by the formula $e = h_{\nu}$, where e is the energy in the photon, ν is the wavelength, and h is a constant (Planck's constant) equal to 6.622×10^{-27} erg sec. (6-318).
- d. Electrical Discharges. Gases and vapourgive off light at ordinary temperatures when they are ionised (4-276) and carrying an electrical current or discharge (3-220).
- e. Luminescence. This includes the other ways in which light is produced at room temperatures.

Fluorescence occurs with certain substances that absorb radiation at short wavelengths (e.g. electrons, X-rays, ultra-violet rays)

and emit all or part of the same energy in light rays (6-161). Fluorescent substances (called phosphors) are used in television and oscilloscope tubes, luminous watch dials, fluorescent inks, etc. Where there is delay between absorption and emission so that the substance goes on glowing for a long time in the dark, the phenomenon is called phosphorescence (6-162).

Chemiluminescence occurs when light at room temperatures is produced directly by some chemical reaction, which is almost always an oxidation. Thus, phosphorus glows when the vapour round it unites with oxygen. All biological "phosphorescence' (bio-luminescence) is believed to be of this type (6-162).

C. Colour. The sensation of colour is produced by different wavelengths of light; but owing to the complicated mechanism of colour vision, different combinations of wavelengths may produce the same colour sensation. White light results from a mixture of light of all wavelengths (2 462).

- a. Dispersion and Spectra. Different wavelengths of light travel at the same speed in a vacuum, but the longer wavelengths travel more slowly than the shorter wavelengths through denser media. For this reason the refractive index of glass is higher for light of shorter wavelengths; and if white light is passed through a glass wedge or prism in such a way that refraction occurs twice in the same direction, the colours will be spread out or dispersed into a spectrum. The same result can be obtained by means of diffraction and interference when the light passes through a finely ruled grating. Instruments for producing and measuring spectra are called spectromoters (7-127).
- b. Line and Band Spectra. Incandescent substances give out light of cortain wavelongths only, so that the spectra produced consist of narrow lines and bands. The lines are produced when electrons jump from higher to lower energy levels, the bands by various forms of vibration in the molecules. In either process energy can be exchanged only in complete bundles or quanta.

Similarly, when white light passes through substances (usually in the form of gases), precisely those wavelengths are absorbed that would be given out if the substances were energetic. Again the energy-exchange can take place only in complete quanta

(1-299).

D. Photo-electricity. There are three ways in which light can affect electric circuits:

- a. Photo-emission. Light falling on certain substances (e.g. sodium, potassium, caesium, strontium) leads to the ejection of electrons. This effect is made use of in the photo-electric cells used in the reproduction of film soundtracks, and in television cameras (6-163).
- b. Photo-Conductivity. Some substances (e.g. selenium, lead sulphide) have their electrical conductivity greatly increased when light falls on them (6-163). Photo-conductive

- cells are used to turn light on at dark and off at dawn (e.g. on light buoys); and for detecting infra-red rays in spectrometry, and in burglar alarms, etc. (6-164).
- c. Photo-Voltaic Effect. A small e.m.f. is produced when light falls on the interface between certain substances (e.g. copper and cuprous oxide). This effect is used chiefly in photographic exposure meters (6-164).
- E. Polarisation. In polarised light, the magnetic displacements take place in all directions at right angles to the path of the ray. In planepolarised light they take place in one direction (i.e. one plane) only; the electric displacements, being always at right angles to the magnetic, are similarly confined to one plane (4-501).

Plane-polarisation can be produced by reflection at certain angles; by certain crystals which have the property of birefringence; and by artificial arrangements of crystals bedded in plastic called polaroid sheets or screens.

- a. Polarimetry; Saccarimetry. Many substances in solution make the plane of polarised light rotate. The extent and direction of this rotation can be used to determine the nature of a substance or the strength of a solution (4-501; 7-186).
- b. Other Uses of Polarised Light. Polaroid spectacles are used to reduce the glare of sunlight reflected from snow or sea. Also in some systems of three-dimensional cinema (7-156). Polaroid windscreens, combined with polarised headlamps, have been suggested as a means of reducing dazzle in night driving
- F. Photo-Chemistry. The incidence of light promotes a number of chemical reactions that do not take place at all, or only very slowly, in the dark. One example of this is the blackening of silver salts (e.g. silver bromide) used in photography (6-181). Another is the use of light energy by green plants to build up sugarand other carbohydrates out of water, exygen, and carbon dioxide (6 182).
- Photometry. All methods of measuring "amounts of light" depend in the last instance on judgments by the eye that two areas are equally illuminated.

a. Units. These are based on an arbitrary standard (the candle), since the sensation of brightness does not correspond exactly with

physical measurements of energy.

b. Luminous Intensity. Unit, the candle originally defined as the intensity of a spermaceti candle of fixed dimensions; now defined as one-sixtieth of the intensity per sq. cm. of a black body (or cavity) at the temperature of melting platinum. called candle-power and candela.

c. Luminous Flux. Unit, the lumen amount of light flowing in one second through 1 sq. em. of the surface of a sphere 1 cm. in radius with a source of 1 candle at the centre.

d. Illumination. Units, the lux or phot: illumination of a surface which receives I lumen per sq. cm.; the foot-candle: illumination of a surface which receives I lumen per sq. foot.

PHYSICS

ATOMIC AND NUCLEAR PHYSICS

This branch of physics is concerned with the structure of the atom, with changes in its nucleus, and with the behaviour of sub-atomic particles both inside it and outside it.

- A. Structure of the Atom. The first suggestion that the atom had a sun-and-planet structure came from Rutherford in 1911. Since then all models of the atom have pictured a minute central nucleus carrying almost all the mass, surrounded at relatively large distances by electrons in orbits, shells, orbitals or energy levels (1-297).
 - a. Fundamental Particles.

Electrons have a negative electrical charge e equal to 1.6020×10^{19} coulomb, and a mass m equal to 9.1078 × 10 28 gm.

Protons have a positive electrical charge of the same size as that on an electron and a mass of 1.6725 \times 10⁻²⁴ gm., i.e. equal to about 1,837 electrons.

Neutrons have no electrical charge and a mass of 1.67469 × 10 24 gm., i.e. slightly larger than a proton.

b. Nucleus. This is made up of a number of protons, Z, plus a number of neutrons, which is usually rather more than 2Z; making a total number of nucleons, A. Z is called the atomic number, A the mass number (1 298).

The nucleons are held together by forces which are very great at very short distances, but rapidly decrease with separation. nature of these forces is not known, though several theories have been put forward to describe them (1-300).

- c. Electrons. The number of electrons surrounding the complete atom is equal to the number of protons in the nucleus, so that the complete atom is electrically neutral (1-298). If electrons are either lost or added, the atom becomes charged and is called an ion (4-276).
- d. Elements. The atomic number, Z, determines what element an atom belongs to, and its place in the periodic table (3 224). Chemical properties depend on the surrounding electrons, particularly those in the outer shell (2-318).
- B. Radio-activity. First discovered by Becquerel m 1896 in uranium. Radium was investigated by the Curies. Rutherford initiated the presentday theory.
 - a. Rays. Radio-active substances give off one or more of the following rays:

Alpha-Rays: streams of helium nuclei (two protons plus two neutrons).

Reta-Rays: streams of electrons.

Gamma-Rays: electromagnetic waves with wavelengths below about $\overline{10}^{-10}$ cm. (6-351).

b. Physiological Effects. Radio-active rays, particularly y-rays, are in general injurious to living tissues. Their destructive effect is greater, however, on rapidly multiplying cells; hence their use against cancer (6-352). c. Methods of Detection. All three rays in varying degrees ionise gases through which

they pass, and so make them conducting (4-276). This makes it possible to detect the rays by the leakage of a charged gold-leaf electroscope; by particles counted by a Geiger counter; and by the paths of rays made visible in a Wilson cloud chamber. Paths of rays can also be traced in photographic emulsion which is affected by the rays in the same way as by light.

d. Disintegration. In giving out a- and β-rays, the atom concerned is changed into an atom of a different element. In this way three natural radio-active series are formed, the end product in each being an isotope of lead (6 351).

- e. Half-Life. There is no means of telling when any particular radio-active atom will disintegrate, but of a large number of atoms of any given substance half will always have disintegrated within a characteristic period called the half-life of that substance (6 352).
- C. Artificial Disintegration. This can be brought about by bombarding target atoms with streams of suitable particles at high energy. The particle streams can be derived from radio-active substances, from accelerators, or from nuclear reactors (1 299).

Accelerators. Linear accelerators, cyclotrons, synchrotrons, etc., are machines for producing such particle streams and accelerating them to high speeds in electric fields (8-17).

- D. Cosmic Rays. Many particles also occur naturally m, or as a result of, cosmic rays which arrive at the earth from outer space. Cosmic rays include mesons of various masses intermediate between electrons and protons; positrons, with the same mass as electrons but a positive electric charge; deuterons, made up of one proton plus one neutron; and occasionally larger particles (6-339). All can be detected by Geiger counters and their paths traced in photographic emulsion.
 - . Nuclear Fission. In this process a large nucleus splits into two medium-sized pieces. A slight loss of mass is accompanied by a relatively large release of energy, the relation conforming the Einstein's equation $E = mc^2$ (6 381).
 - a. Fission Bomb. In uranium-235 and plutonium the process occurs when the nucleus is hit by a neutron; and involves the ejection of an average of 2½ or 3 neutrons. Hence in a mass of metal of sufficient size, fission builds up as a chain reaction. This is the basis of the original atomic or fission bomb, which explodes when a critical mass of uranium-235 or plutonium is suddenly brought together (1-300).
 - b. Hydrogen Bomb. This works on the opposite principle of uniting hydrogen nuclei to form nuclei of helium. To do this, however, requires such high temperatures that the process must be started off by a fission bomb (1-301).
 - c. Nuclear Reactors. In these the fuel is natural uranium, the chief isotope of which, uranium-238, undergoes fission only when

PHYSICS-PHYSIOLOGY, HYGIENE, & MEDICINE

hit by a comparatively slow-moving neutron. They contain, therefore, considerable quantities of graphite or heavy water to slow down the fast neutrons resulting from fission. By means of cadmium rods which absorb neutrons the chain reaction is controlled and not allowed to build up into an explosion (1-301). The heat from nuclear reactors can be used

to produce electricity. The enormous flux of neutrons which can be obtained from them is used to make radio-isotopes of many elements for use in research and medicine.

Elaborate precautions have to be taken to protect workers from exposure to the highly dangerous radiation from nuclear reactors and their products (1-302).

PHYSIOLOGY, HYGIENE, & MEDICINE

A SOUND knowledge of the structure of the human body and the normal function of its various parts is essential to healthy living. This Outline is intended merely as a brief survey of the chief parts of the body and their work, the simple laws of hygiene, and a few of the outstanding features of medical history and practice.

I. THE HUMAN BODY.

Anatomy (1-143); Physiology (6-189).

- A. Framework of the Body.
 - a. Skeleton (7-60; 1-144 diag.).
 - b. Composition of bone (1-518).
 - c. Hands (4-125).
 - d. Feet (8-412).
- B. Muscles (5-298): how the body is moved.
- C. Digestion (3-89): process by which food is changed so that it can be absorbed by the body.
 - a. The teeth (7-236) prepare food for digestion.
 - b. The tongue (7-290).
 - c. The stomach and how it works (1-144,
 - 3-89, 90; 6-191 illus.).
 - d. The liver (4-624), largest gland organ in the body.
 - e. Other glands that aid digestion (4-27).
 - f. Enzymes (f.-i.): chemical substances that aid digestion.
- D. Circulation (4-143, 144 diag.).
 - a. The blood (1-489) and its journey through the body.
 - b. The heart (4-143): hub of the circulatory system.
 - c. Function of the lungs in circulation (5-52).
 - d. The pulse (6-304).
- E. Respiration (6-389).
 - a. The lungs (5-51).
 - b. The diaphragm (f..i.): principal muscle of respiration.
 - c. The voice (7-404) and its organs.
- F. Removal of Body Wastes.
 - a. Function of the intestines (3-90, 89 diag.; 1-144).
 - b. The kidneys (4-403): the filtering plant for the blood.
 - c. The sweat glands (7-63).
- G. Glands (4-27) and their functions.
- H. How the Body is Governed.
 - a. The brain (2-40): the executive offices of the body.
 - b. The nerves (5-368): the body's telephone system.
 - c. The senses and their organs: eye (3 331); ear (3-147); tongue (7-290) and other organs of taste (7-229); sense of smell (7-71); touch (7 301).

- I. The Skin (7-68): covering of the body.
 - a. Hair (4-117).
 - b. Nails.

Note: Students should also read the main article on Biochemistry (1-446).

II. THE CARE OF THE BODY.

Hygiene (4 223).

- A. Exercise (4-223).
 - a. Physical education (6-183).
 - b. Athletics (1 290).
 - c. Sports, Games, and Pastimes: see under this heading in the Fact-Index.
 - d. Eurhythmics (3-307).
- B. Food (3-408): what to eat for health.
 - a. Proteins (6 297) and the foods that contain them.
 - b. Vitamins (7-403): substances essential to proper growth and health of the body.
- C. Sleep (7-67) and its value.
- D. Sanitation and Ventilation.
 - a. Personal cleanliness (4 223).
 - b. Heating (4-149) and Ventilation.
 - c. Uses of Antiseptics (1-176).
- E. Public Health.
 - a. Plumbing (f.-i.) and Sewerage.
 - b. Water supply (7-425).

Note: Additional information on Hygiene is contained in many of the articles referred to in Sections I and III of this Outline.

III. HUMAN ILLNESS.

Medicine (5-161) and Surgery (7-194).

- A. Germs in disease (4-14).
 - a. Bacteria (1-343).
 - b. Protozoa (6-293; 4-14).
- B. Disease Carriers.
 - a. Mosquito (5-271): carrier of malaria (5-93) and yellow fever (5-271; 6 53).
 - b. Flea (3-388): carrier of bubonic plague (1-478).
 - c. Tsetse fly (7-323): carrier of the dreaded sleeping sickness (7-323; 4-15).
 - d. House fty (4-264): carrier of typhoid, etc.
- C. Prevention and Treatment of Disease.
 - a. Antitoxins (f.-i.) and Serums (1-490).
 - 1. Vaccination (7-878).

SCULPTURE

2. The work of Pasteur (6 94). b. Surgery.

1. Anaesthetics (1-142).

2. Use of Antiseptics (1-176).

8. Use of the X-rays (7 507) and radium (f.-i.).

c. Drugs (3-127); antibiotics (1-174); sulpha drugs (7-186); streptomycin (1-175).

Note: Many of the common drugs improperly

used are poisons. For some of the principal poisons and their antidotes, read the articles on Poisons (6 235) and First Aid (3 365).

d. Dentistry (2 236).

D. Auxiliary Medical Agencies.

a. Hospitals (4 199); nursing homes; health centres; convalescent homes.

b. Nursing (5 485) and First Aid (3 365): Red Cross Societies (6 370).

SCULPTURE

SCULPTURE (6-519), the art of carved and moulded form, is the most durable of the arts. Works of great beauty in this medium have lasted to this day from ages whose painting has disappeared or left but faint traces of what it may once have been. Most sculpture, moreover, presents its subject in the round and so, being easier of apprehension than painting, is usually the first art to attract the interest and appreciation of young people not specially gifted as draughtsmen.

I. SCULPTURAL PRACTICE.

A. Relief (6-519).

a. Bas-Rehef or Low Rollef (1-338 illus;
 6 522 illus.). In these sculptures the figures project only a little from the background.

b. High Relief (4-90 illus.; 6-445 illus.). Here the composition as a whole is part of the slab, but limbs and heads of individual figures here and there are almost free.

c. Sunk Relief. In this method the artist cuts into a flat surface so as to leave the figures standing in relief on a sunken ground.

- B. Intaglio (6 519). In this method—the opposite of relief—the design is hollowed out below the surface. It is used mainly in the carving of precious stones and in making seals (3 292; 2 189).
- C. Sculpture "in the round." This is the most complete" form of sculpture, the figures being, in part at least, completely "free," so that they may be viewed from all sides.

II. PRIMITIVE WORKS

The beginnings of sculpture arise wherever men have the impulse to adorn articles of use with decorative shapes, or to give outward form to their imaginings concerning the gods or spirits they wer hip, as did some of the Stone Age peoples (5-107 illus.), 108 illus.), and the Alaskan tribesmen who carved totem-poles (1-88 illus.); or to erect memorials bearing the features of the dead, as possibly did the unknown people that carved the stone figures of Easter Island (2-359).

III. EARLY DEVELOPMENT

A. Egyptian Sculpture.

a. (haracteristics and Materials (6-520). b. Typical Examples: The Sphinx (7-130 illus.); statues, etc. (3 187 illus., 201 illus. etc.); reliefs (3-186 illus., 188 illus., 194 illus., 199 illus.).

B. Babylonian and Assyrian Sculpture.

a. Characteristics (6-520).

b. Typical Examples: Assyrian animal sculpture (1-338 illus.); warriors (1-339 illus.); winged bulls (2-89 illus., subject 12), which

are as typical of Assyrian sculpture as the Sphinx is of Egyptian.

Aegean Sculpture (1 23 illus.).

IV. GREEK (4 89) AND ROMAN (6 440)

Archaic (Attic) Greek.

The Great Age of Greek Sculpture.

a. The work of Myron and Polycleitus, and of Pheidias (6 153; 4 89; 3 228; 1-12; 5 510; 7-1, 523), greatest of Greek sculptors. "Discus Thrower" of Myron (4 84 illus.); statue of Zeus by Pheidias (4 74 illus. f.); Parthenon frieze (2 89 illus.; 4 90 illus.); the Venus de Milo (4 87 illus.; 5 47 illus.); Erechtheion Caryatdes (4 73 illus. f.).

b. The work of Praxiteles (4 90), Scopas (4 90), and Lysippus (4 90), the "Hermes" of Praxiteles (4 85 illus.). To this period, too, belongs the Alexander sarcophagus (1 99 illus.)

Later Greek and Roman Sculpture. Despite a gradual loss of directness and simplicity and an increasing tendency towards realism, affectation, and ostentation, the Greeks produced many beautiful works in the 4th century B.C., and the Romans created fine portrait statues before art was extinguished in the West about the 4th century A.D.; Etruscan work influenced them.

a. Late Greek Sculpture: "Dying Gaul" (4-91).

b. Roman Sculpture, influenced by that of the Greeks (6 441 dlus., 442 dlus., 443 illus., 444 illus.).

V. MEDIEVAL AND RENAISSANCE.

. Medieval (6-520).

a. Byzantine. Chiefly carving and small works, often of great beauty (2 150 illus.). b. Early Gothic. Sculpture in the early Christian centuries, hampered by literal interpretation of the commandment against making "any graven image," was confined chiefly to sarcophagi, crucifixes, and objects for the adornment and use of the Church. With the rise of Romanesque and Gothic cathedrals and churches, sculpture was more

and more freely used as an adjunct to architecture. Early Gothic artists worked "for the glory of God" and not for fame, and their names are lost. Many religious sculptures—for example, the Irish Romanesque crosses—show various stages of artistic development.

c. Late Gothic in Italy. Many of the Italian sculptors of this period were painters and architects as well. Such were Niccolo Pisano (f.-i.), whose work shows a study of the antique and thus foreshadows the Renaissance; Giovanni Pisano (f.-i.), son of Niccolo; and Andrea Pisano (f.-i.), pupil of Giovanni.

B. Renaissance (6-384).

a. Italian Renaissance. Among the great sculptors of the Renaissance were Gluberti (f.-i.; 3-392); Donatello (4-320; 6-519 illus.); the Della Robbras (4-320; 6-385 illus.); Verrocchio (4-320, 328 illus.); Leonardo da Vinci (4-482); Michelangelo (5-190; 4-327 illus.; 3-53 illus.); Benvenuto Cellini (4 320, 328 illus.); Giovanni da Blogna (f.-i.). b. French Renaissance. The Renaissance dawned late in France. Jean Goujon and Germain Pilon were its most important sculptors, and their work, though graceful and often vigorous, shows the florid affectation of a declining age.

VI. "BAROQUE" AND THE LATE CLASSICAL REVIVAL.

- A. "Baroque" (6-524). In Post-Renaissance sculpture (17th-century) statuesque dignity gave way to violent fluttering movement and florid excesses. The chief sculptor and architect of this period was the Italian J. L. Bernini (f.-i.; 1-183 illus.; 6-228 illus.), a man of great talent and versatility, who filled Rome with "an almost incredible quantity of sculpture of the most varying degrees of merit and hideoueness." From Italy this movement spread all over Europe.
- B. Classicist Revival. A period of cold formal classicism followed the extravagances of the "baroque" style. The leading figures in this movement were Canova (6-524), an Italian sculptor, and Thorvaldson, a Dane (6-524). John Flaxman (f.-i.; 6-524) was a notable follower of this manner in Britain.

VII. NINETEENTH AND TWENTIETH CENTURIES.

A. The Nineteenth Century.

a. In France especially a new, more living sculpture sprang up in revolt against the classical manner. This was led by such men as Barye (f.-i.) and, in Britain, by Alfred Stevens (6-524). Gradually, too, even greater freedom began to show itself.

b. The outcome of the reaction from pure "naturalism" was the work of Auguste Rodin (6-425, 524) which began in Impres-

sionism.

B. The Twentieth Century.

a. On the Continent. From Rodin onwards, sculpture developed rapidly, and each successive school of painting was reflected in its sister art. The work of Ivan Mestrovič (f.i.; 6-520 illus.) is typical of much fine 20th-century work.

b. In Britain. Although a majority of sculptors continued in the academic tradition, as exemplified by the work of Sir George Frampton (f.-i.; 1-372), others turned to more original styles. C. S. Jagger (f.-i.; 6-523) illus.; 7-10 illus.) and Eric Gill (6-522 illus.) show two types of development, the latter being especially moved by religious feeling and interest in the classicism of Rome. Sir Jacob Epstein (3-294) had tremendous influence, both in his large architectural works (6-523 illus.) and in his smaller, finely modelled portrait busts. Frank Dobson (6-524), Barbara Hepworth (6-524), Henry Moore (6-522 illus.) showed abstract, at time-Surrealist (3-449), influence.

VIII. ORIENTAL.

A. Indian (4-245). In India, sculpture went back to thousands of years B.C., being at one time influenced by Greek invaders (4-249 illus.). In general, it is a naturalistic style tending toward the monstrous and exuberant (4 248 illus.).

B. Chinese and Japanese.

a. The Chinese have practised sculpture in stone from early times, and with the rise of Buddhism a school of sculptors sprang up, but their art was much influenced by Indian models (2-215 illus.). The real beauty of Chinese sculpture lies in the exquisite bronze and ivory carvings of the Golden Age, which have influenced the art of many lands.

b. The Japanese (4-351; 5-121) seem to find little beauty in the human figure. Yet the "Nara school" (6th to 12th century A.D.) ranks with the Florentine school of European sculpture. As elsewhere in the Orient, religion had the greatest influence on sculpture (2-107 illus.).

Interest-Questions in Sculpture

Rome ? 5-190

sculpture? 8-440

What is "relief" in sculpture and what is its opposite? 6-519
What is plastic sculpture? 6-519
With what Italian city is Michelangelo especially associated? 5-190
Whe is the greatest known ancient Greek sculptor? 4-80
Where is the horse first represented in sculpture? 3-197
Where is the Venus de Milo to be seen? 4-90
When is a piece of sculpture said to be "glyptio"? 6-519
Which Italian sculpter is associated with Henry VII's tomb in
Westminster Abbey, London? 6-835 lilus.

Did the ansient Greeks use solour in their soulpture? 4-89
What does the celebrated Leocoda group depict? 4-01

Of what metal is the figure of "Eros" in Plecadilly Caques, wondon? 6-521 f Who designed "Rime" and what does it represent? 8-294

A soulptured group by Henry Moore stands in Battersea Park.
London. What does it represent? 6-622 f.

Which famous sculptor designed the tomb of Pope Julius II at

in what respect did the ancient Romans show originality in their

A celebrated French scuiptor made his reputation in 1877. Who was he, and what was the name of his exhibit? 6-426

SOCIAL SCIENCES

THE social sciences cover those branches of knowledge that deal with the problems of men in their relations with one another. They treat of human conduct and of the influences that shape it, and are usually divided into Sociology, Economics (3-159), and political science, that is, Government (4-49) and Politics (6-254).

The name sociology is often applied broadly to the whole group of social sciences, but in its more restricted sense it deals with those phases of human conduct that are governed by usage and custom rather than those that are the outgrowth of political or economic necessity; it seeks to investigate the "social habits" of the human race and their effects upon human welfare. Economics deals with the activities of men in producing, distributing, and consuming the valuable things of the earth. Political science deals with the organization and life of the State. The name "civics" is often given to that department of political science which deals with the practical machinery of government and with men's duties as citizens. All these human activities have developed against the background of Geography (3-513; 8-83) and History (4 180; 8-117).

SOCIOLOGY

I. ANTHROPOLOGY.

The study of Man's physical development, his place in Nature, and the origin of culture, with particular reference to primitive life and the survival of primitive modes of living and methods of thought. Anthropometry, the science dealing with the physical measurements of the different groups of mankind, is a branch of anthropology (f. i.). Read the article on Man (5 104).

II. ETHNOLOGY.

The study of the various blood-groups and their customs, with a view to finding out their origin and relationships.

- A. Divisions of Mankind (6 333).
- B. Cave-dwellers (2-282).
- C. Stone Age (7 161).
- D. Superstitions and Magic (5-77).
- E. Mythology (5-312).

III. PHILOLOGY (6 158).

The science which deals with the formation of languages (4 445). By the study of words used by early peoples, scientists have been able to ascertain many important things about the people who made the words and their mode of life. See also Alphabet (1-119).

IV. CUSTOMS AND INSTITUTIONS.

- A. Family: first important social unit. Clan (2 406); tribe; marriage (5-133).
- B. Origin of names (5-314); nicknames (5 433).
- C. Magic (5 77) and Witchcraft (7-464).
- D. Folklore (3-405).
- E. Architecture (1-209), and what it tells of human progress.
- F Clothes (2-420) and Adornment.
 - a. Tattooing (7-230).
 - b. Armour (1-248).
 - c. Boots and shoes of different periods and lands (2-13).
 - d. Hats and caps (4-136) and their history.
 - e. Buttons (2-146) and how they came into
 - f. Lace (4-485) and its history.

- g. Orders and decorations (5-529).
- h. Crowns (2 536) and coronets (f.i.).
- i. Horaldry (4-164).
- G. Etiquette (3-802): the essentials of good manners as established by custom.
- H. Holidays and Festivals (4-186); Calendar (2-174).
 - a. Christmas (2-381), and its celebration in different countries.
 - b. Easter (3-154): its significance, and customs connected with it.
 - c. Hallowe'en (4-119, 134) and superstitions associated with it.
 - d. New Year's Day (5 409) in various parts of the world.
 - e. Eistoddfodau (3-207).
 - f. The Passover (6-94).
 - g. 'l'he Sabbath (6-488).
 - h. Harvest home (4-134).
 - i. Coronation of the Sovereign (2-509).
 - j. St. Valentine's Day (7-374).

V. AMUSEMENTS, GAMES, AND SPORTS.

- A. Olympic Games, ancient and modern (5-508).
- B. Gladiatorial Combats of the Romans (4-25; 2-404).
- D. Modern Sports and Games.
 - a. Outdoor Games: badminton (1-846); baseball (1-877); basket ball (1-878); bowls (2-29); cricket (2-528); curling (3-12); fives (3-885); football (8-414); golf (4-44); hockey (4-183); hurling (4-210); lacrosse (4-435); lawn tennis (4-460); netball (5-869); quoits (6-326); etc.
 - b. Sports: bathing (1-884); boxing (2-29); cycling (8-14); motor-cycling (5-273); gliding (4-33); hunting (4-209); riding (6-400); skating (7-59); swimming and diving (7-207); etc.
 - c. Indoor Pastimes: billiards (1-445); games with playing cards (2-221); chess (2-328); dancing (8-37); darts (8-50); dominoes (8-107); draughts (9-109) draughts (3-122); stamp col-(3-107); lecting (7-143); etc.

SOCIAL SCIENCES

- E. The Drama (8-114) and the Theatre (7-263).
 - a. Morality plays of the Middle Ages (3 118, 117 illus.).
 - b. Ballet (1 351).
 - c. Pantomime (6 60); Punch and Judy (6-308); puppers (6-310).
 - d. Cinoma (2-389).
 - e. Broadcasting (6 340) and television (7-251).

VI. SOCIAL ORGANIZATIONS.

In the complicated social life of to day one great branch of Man's activities centres about clubs (2 423) and other societies formed for the pursuit of a common interest.

- A. Religious Organizations.
 - a. Crusading Orders (4 418; 3 2 with illus.).
 - b. Monasticism (5-243, 485).
 - c. Salvation Army (6-493); Church Army (f.-i.).
- B. Fraternal Organizations.
 - a. Friendly societies (f.-i.).
 - b. Trade unions (7-304).
 - c. Freemasonry (3 464).
- C. Boys' and Girls' Societies.
 - a. Boys' Brigade (f.-i.); Boy Scouts (2 33).
 - b. Girl Guides (4 22).
 - c. Youth Clubs (2-424).

VI. PROBLEMS OF SOCIOLOGY.

- A. Protection of the Weak.
 - a. Child Welfure: Children (2 336) and their education (8-166).

- b. Care of the poor, old, disabled, and unemployed; state insurance (4-271); retirement pensions (6-120); education of the blind (1 485); education of the deaf (3 56); etc.
- c. Care of defectives and delinquents.
- d. Prisons (6 -290): places of punishment and of reform.
- B. Preserving Health and the relief of suffering.
 - a. Hospitals (4-199).
 - b. National Health Service (f.-i.).
 - c. Factory and food inspection.
 - d. Red Cross Societies (6-370).
 - e. Nursing (5 485).
- C. Private Philanthropy. Before public responsibility for the relief of suffering, the provision of education, and other social services was recognized, many private individuals contributed work and money to these ends, and have continued to do so.

Some Prominent Philanthropists: Florence Nightingale (5 437), founder of modern imbary and civilian nursing. Thomas Coram (1.-i.) and the Foundling Hospital (1.-i.), George Peabody (1.-i.), and his buildings for working people; Thomas John Bainardo (1 369), friend of "street arabs"; General Booth (2 13), founder of the Salvation Army, Lord Shaftesbury (7 11); John D. Rocke feller (1.-i.); Cecil Rhodes (6 393, 20); Andrew Carnogio (2 244); Alfred Nobel (5 445); Lord Nuffield (5 473; 6 18).

ECONOMICS

Economics (3 159) is a "bread and-butter" study, dealing with the production, distribution, and exchange of all forms of wealth.

I. LAND.

Land is the basis of all wealth, because it is the source of all the raw materials of production. The share played by land in the production of wealth can be measured in terms of rent (3-159). The development of Agriculture (1 70) and its economic effect.

II. CAPITAL AND LABOUR.

The share of labour in the production of wealth is measured in wages; that of capital, or accumulated wealth, is measured in interest (3-160).

- A. Capital (3 160) and capitalism (f.-i.).
- B. Division of labour.
- C. Forced Labour—slavery (7-65) and serfdom (8-348; 7-65).
- D. The Industrial Revolution (4-259) and growth of the factory system.
- E. Organization of Labour: medieval guilds (4-103); modern trade unions (7-304).
- F. Arbitration (f.-i.) in labour disputes.
- **G.** Socialism (7-81).
- H. Communism (2 474).

III. MANAGEMENT (3-160).

Through the efforts of men of enterprise (managers),

land, labour, and capital are brought together and put to productive use.

IV. FINANCE.

The work of obtaining and using money and credit for the support of public and private enterprises

- A. Money (5 233).
- B. Credit (2 11) and Banking (1-363).
 - a. Savings accounts (1 365).
 - b. Banknotes (5-236; 1-362, 363).
 - c. ('heques (1-364; 5 236).
 - d. Interest (3-160).
 - e. Bankruptcy (1-363).
 - f. Foreign Exchange (3-418).
- C. Public Finance.
 - a. Taxation (7 230).
 - 1. Customs and excise (2-12).
 - 2. Stamp duties.
 - 3. Income tax (f.-i.; 7-231) and death duties (7-231).
 - 4. Licences (6-272).
 - b. National Debt.
 - c. Gold Standard (4 43).
- D. Stocks and shares (7-158).

V. PRODUCTION AND DISTRIBUTION.

- A. Organizations for Production and their regulation.
 - a. Companies.
 - b. Trusts (f.-i.).

SUCIAL SCIENCES

- c. Co-operative societies (2-499).
- d. Municipal undertakings.
- e. Nationalisation and government ownership.
- f. Building societies (f.-i.).
- B. Commerce and Transport.
 - a. Railways (6 354).
 - b. Ships (7 28).
 - c. Air transport (1 85).

- d. Roads (6 404).
- e. Post Office (6 270). f. Telegraphy (7-237); Telephones (7 240); cables (2 152); radio-telephony (6 352); etc.
- g. Fairs (3 836) and Markets.
- h. Hire Purchase.

VI. INSURANCE (4 271).

POLITICAL SCIENCE (Civies)

I. ORIGIN OF GOVERNMENT.

If Man were a solitary creature who did not come in contact with his fellows, he might do as he pleased without restraint, except by Nature. But Man early learned that it was to his advantage to live and work with his fellow-men, and found hunself better able to survive and make progress m society than out of it. And so his liberty became limited by such rules as were necessary for the public good. An early social unit was the family; but it is not yet known whether this originated before or after the development of tribal or patriarchal government. By gradual evolution this early system gave place to the complex organization called the State, a term used primarily to designate any community having an independent existence and possessing a sovereign government. Government (4 49) is the machinery by which a State makes or enforces the rules of action necessary to enable men to hve together in peace and security. It is the subject matter of Politics (6 254).

II. FORMS OF GOVERNMENT.

- A. Monarchy. A government in which the sovereign authority is vested in one person, called a sovereign, monarch, king, emperor, etc., while those under his rule are called his subjects; it is usually hereditary, but may be elective. Monarchies are divided into two
 - a. Absolute Monarchy. One in which the monarch's power is unfimited by any principles of government; it is sometimes called an autocracy, and if the rule is cruel or severe, a despotism or tyranny.
 - b. Limited Monarchy. One in which the ruler is limited in the exercise of his power by a constitution; it is also called a constitutional monarchy. Great Britain is an example; others are Denmark, Norway, Sweden, the Netherlands.
 - c: Feudal System (3-348). Under this system, the king was the nominal owner of all the land. It was distributed, however, as "fiefs" among his vassals, who owed him in return homage and military aid in time of need. These royal vas als in turn distributed their land in smaller fiefs to lesser vassals, and so on down.
- B. Aristocracy. A State ruled by a few nobles; literally the name means "rule of the best," and the ideal aristocracy (as in Plato's "Republic ") was controlled by a few men of superior wisdom. When those who held the power did so, not by virtue of character but by virtue of birth or wealth, and allowed their own selfish

interest to predominate, the aristocracy became ' an Oligarchy. In modern states the aristocracy plays an inconsiderable part in government as the Peerage (6-106).

- C. Democracy (3 69). A government in which all the members of the State possess, at least in theory, an equal share of the sovereignty.
 - a. Pure Democracy. One in which the government is carried on directly by all the people of a community there were examples in ancient Greece (4 76; 1 288). This form is now found only among savage tribes and as a form of local government in small towns. b. Representative Democracy. One in which the government is delegated to a body of men, elected by the citizens of the State. The vote is usually by ballot (1 856).
- D. Dictatorship. A Dictator is a ruler excreising complete power over the state that accepts him, usually in a time of crisis. Dictatorships occurred in both ancient Greece and ancient Rome (6 430). Outstanding modern examples have been the Fascist regime (3 341; 4 316) m Italy under Benito Mussolmi (5 310), and Nazisin (5 328; 7 485) in Germany under Adolf Hitler (4 181).
- E. Communism (2 474) and Socialism (7-81). Under these systems of government the State owns and controls for the benefit of every citizen all essential industries and means of distribution. The Communist government of Russia (6 473) claims that that country is one stage on the way to the perfect society in which all outward forms of government would wither away.
- F. Anarchism. This demands the complete abolition of the State as it exists to-day, substituting instead some form of industrial cooperation.

Note: A government may be single or unitary: that is, it may consist of a single State in which there is single sovereignty; or it may be federal, consisting of a union of States which have surrendered their right to act independently in matters pertaining to the common interest, while in other respects they have retained complete independence. France, for example, has a unitary The United States of America, government. Australia, the Soviet Union, and the Republic of India are among countries having federal governments.

III. CONSTITUTIONS.

With the wane of absolute monarchies and the growing tendency towards democracy, the authority of rulers came to be limited or defined. The first such limitation in England took the form of a charter, the famous Magna Carta (5-80), granted to the English barons in 1215 by King John (4-878). Other historic documents of the kind are the Bill of Rights (1 446); the constitution of the United States of America, which came into effect in 1789 (7-361); and the constitution proclaimed in the same year by the French Assembly which included the immortal "Declaration of the Rights of Man" (1-446). A constitution may be either written or unwritten.

IV. FUNCTIONS OF GOVERNMENT.

A government, no matter what its form may be, has three functions: legislative, judicial, and executive.

- A. Legislative Branch. The legislative branch of a government makes the laws. In countries which, like Britain, have a parliamentary form of government, the line between the legislative and executive branchs is not very clearly drawn, but in the United States of America, for instance, the legislative branch is sharply separated from the executive branch of the government.
 - a. Law (4-457); Roman law (6-440); the Code Napoléon (8-452).
 - b. British Parliament (6-86): the law-making body for the British Isles and the Crown Colonies, and one of the oldest legislative assemblies in existence. See also Cabinet (2 151).
- B. Executive Branch, or Civil Service (2-405): that branch of government which administers and enterces the laws.

- C. Judicial Branch or Judiciary: that branch of government which applies and interprets the laws (statute or common).
 - a. Courts of Justice (2-520): their criminal and civil functions; different classes of courts.
 - 1. Habeas Corpus (4-115).
 - 2. Jury (4 387).
 - 8. Prisons and Punishments (6-290).
 - b. Police (6-247).
- D. Taxation (7-230): How a government obtains money to conduct its affairs: how a tax is levied; different kinds of taxes.

V. POLITICAL PARTIES.

In parliamentary constitutions, a large part in the working of the political machine is played by parties, i.e., organizations of men and women who have joined together to promote the political aims they have in common. In Britain the principal parties are the Conservative (or Tory) Party (2 487); the Labour Party (4-427), which believes in Socialism (7-81); and the Liberal Party (4-485), whose aim is reform within the existing system.

VI. INTERNATIONAL LAW (4-459).

- A. Geneva Convention (6-370).
- B. The Hague courts of international justice (4-459).
- C. Some Rules of War.
 - a. Blockede (f.-i.).
 - b. Red Cross activities in war (6-370).
 - c. War Crimes (4 460).
- D. The League of Nations (4 463).
- E. The United Nations (7 354).

ZOOLOGY

Classification of Animals

THE members of the animal kingdom present a far greater variety of structure and function than those of the plant kingdom, for the conditions of animal life are less fixed and stable than those of plant life. Most plants obtain their food directly from the air and the soil; animals are for the most part compelled to move about in search of food and to adjust themselves to a far greater variety of diet. The struggle between animals for survival is more violent and active than between plants, so that the means of attack and escape are much more highly developed and versatile. Because of the greater variety of forms, animals are even more difficult to classify than plants. Differences of opinion exist among authorities, and systems of classification are subject to change from year to year. The tendency, however, is always to arrive at a classification that will bring out the natural evolutionary relationships between animals. The method followed here is based upon the best established systems, with the omission of many of the less important subdivisions. Consult introduction to the Botany Outline for key to abbreviations (8-70); read also the main article on the Animal Kingdom (1-154); Zoology (7-523); Evolution (3-321); Marine Life (5-127).

Phylum I. PROTOZOA (6-298).

This is an unnatural classification consisting principally of microscopic, unicellular, aquatic organisms of primitive and simple form. It is equivalent to the Protophyta among the plants (8-70), and like that group contains a number of forms allotted to animals and plants alike. The following classification, based chiefly on organs

of locomotion, is an artificial one; only the more important groups are indicated.

Cl. Mastigophora (Flagellata): move by meanof a whip-like "flagellum." Numerous orderincluding:

Ord. Euglenoidina: one or two flagella type, Euglena, common in stagnant freel water to which they give green colour.

- Ord. Dinoflagellata: two flagella, often cellulose armour; many parasitic types. Noctiluca is a phosphorescent form found at sea.
- Ord. Phytoflagellata: high forms multicellular; often claimed as plants (8-70). Types: Chlamydomonas; Volvox.
- Ord. Protomonadina: parasitic forms: Trypanosoma, parasite that causes sleeping sickness (4-15; 7-323).
- Cl. Rhizopoda: move by means of "pseudopodia," outgrowths of the cell substance.
 - Ord. Amoebina: Amoeba (1-140), a typical example.
 - Ord. Foraminifera (2-299; 6-298; 5-127 illus.); larger forms with complex calcareous shell. Examples: Polystomella; Globigerina, found in plankton; Nummulites (a common fossil "giant" form).
 - Ord. Radiolaria (1-450; 6-298): large forms with radiating, siliceous skeleton, living in marine plankton (f.-i.).
 - Ord. Mycetozoa: slime fungi, forming gigantic amoeba-like masses such as "flowers of tan," Fuligo varians.
- Cl. Sporozoa: parasitic forms. Sub. el. Telosporidia typnfied by Ord. Haemosporidia, including malaria parasite, *Plasmodium*. Sub.-cl. Neosporidia (Sporozoa): genus *Nosema* causes some diseases of bees and silkworms.
- ('l. Ciliophora: move by means of "cilia," numerous minute hairs.

Ord. Ciliata (Infusoria) contains numerous forms common in pond water; *Paramecium* (1-157 illus., no. 1); *Vorticella* or bell animalcule, etc.

Note: The animals from this point on are called collectively Metazoa, meaning "advanced" forms, as distinguished from Protozoa, meaning "primitive" forms. While most of the Protozoa are single-celled, the Metazoa consist of groups of cells.

Phylum II. PORIFERA.

The Sponges (7-187). Sac-like body of connective tissue with single opening; feed through pores in hody wall. Have "skeletons," or stiffening matter, arranged in "spicules." Typical classes: Hexactinellida, skeleton of silica rods (Venus's flower basket, glass-rope sponges); Calcarea, skeleton of carbonate of lime; Demospongiae, mixed types, skeleton of silica or spongin or both (cup sponges, horny or bath sponges, boring sponges).

Note: Some authorities give the sponges rank as a separate sub-kingdom, Parazoa, divided into Phylum I (Nuda), to which belong the Hexactinellida, and Phylum II (Gelatinosa) containing all other sponges.

Phylum III. COELENTERATA.

Sac-like body; food swept into single orifice or "mouth" by fringe of tentacles; rudimentary onse organs, nerve cells, either scattered throughout body or forming connected system.

Cl. Hydrozoa: Primitive types, tubular or umbrella-shaped. Typical orders: Hydroida,

- least developed forms (genus Hydra, 4-213); Hydrocorallinae, which gather into coral-like colonies with limy skeletons (millepore coral, 5-128 illus. f.); Siphonophora, attached to floating bladders or air-sucs (genus Physalia, Portuguese man-of-war, 4-360 with illus. f.).
- Cl. Scyphozoa: body umbrella-shaped; specialised reproductive and sense organs. Typical order: Discomedusae; genus Aurelia. common jelly-fish (4-360).
- (I. Anthozoa (Actinozoa): individual forms (e.g. sea anemones) and colonial forms (e.g. corals). Have oesophagus and primitive muscular tissue in tentacles; colonial types have stiffening matter of carbonate of line or horny matter.
 - Sub.-cl. Alcyonaria: eight tentacles. Typical families: Pennatulidae, sea-pens, with feuther-shaped upper end; Gorgoniidae, sea-fans (3-frontis.), sea-whips, and precious coral of Mediterranean (2-504).
 - Sub.-cl. Zoantharia: forms with variable structure. Includes order Actiniidae, divisible into sub-orders Actinaria, sea anemones (6-524; 3-frontis.; 1-157 illus.; 5-129 illus.), and Madreporaria, madrepore corals.

Phylum IV. CTENOPHORA.

Transparent, delicate jelly-fish, but not related closely to Coelenterates.

Phylum V. PLATYHELMINTHES.

Flatworms (1-154, 157 illus.); mainly parasitic. Alimentary canal and nervous system well developed; rudimentary blood vessels and muscles.

Cl. Turbellaria, aquatic, ciliated types; Cl. Trematoda, parasitic upon animals (genus Distomum, the liver fluke); Cl. Cestoda, tapeworms.

Phylum VI. NEMERTINA.

Small group of unsegmented marine "worms."

Phylum VII. ROTIFERA.

Wheel animalcules. Microscopic; have "wheel" of cilia about free end; have points of similarity to flat worms, primitive ringed-worms, and molluses.

Phylum VIII. CHAETOGNATHA.

Bristles about mouth, fins on tail (genus Sagitta, a sea worm).

Phylum IX. ACANTHOCEPHALA.

Cylindrical parasitic forms possibly related to Phylum X.

Phylum X. NEMATHELMINTHES.

Round-worms (7-500); muscular, sucking oesophagus, thick skin, parasitic in plants and animals.

Cl. Nematoda: thread-shaped, from microscopic length to 1 yard long; frequently parasitic, disease-causing forms. Typical genera:

Ascaris, round-worm; Oxyuris, pinworm;

Ankylostoma, hookworm; Trichina, cause of trichinosis; Filaria, cause of elephantiasis.

Ord. Gordiacea: hairy worms; typified by horse-hair worm.

Phylum, XI. ANNELIDA (Chaetopoda).

Ringed worms (7 500): cylindrical; body segmented or "ringed"; usually locomotion by bristles. Classes: Polychaeta, marine types; Oligochaeta, fresh-water and soil types (Earthworm, 3 153). Hiradinei: have suckers instead of bristles for locomotion; the leeches (7-500).

Phylum XII. ARTHROPODA.

Rosemble annelld worms in segmentation of body, but appendages are jointed to segments; heavily armoured with chitin; nervous structure resembles spinal cord; organs highly developed. The Arthropods are divided into five main living classes: (1) Crustacea, lobsters, crabs, shrimps, and barnacles; (2) Arachnida, scorpions, spiders, and mites; (8) Diplopoda, millipedes; (4) Chilopoda, centupedes; (5) Hexapoda or Insecta, insects. In addition, there is the small class Onycophora, consisting of the strange enterpular-like Perip tius, and considered to be in many ways ancestral; and the small group of spider-like marine creatures, the class Pycnogonida.

Note: Because of the vast size and many subdivisions of the phylum Arthropoda, considerable space has had to be devoted to each of its divisions.

Class CRUSTACEA, Crustaceans.

Chitinous shell strengthened with lime; gills (modified for air-breathing in land types); appendages develop several branches in swimming types; have horny carapace or "shell" over combined head and thorax (cephalothorax).

Sub-cl. Branchiopoda: primitive, aquatic forms: typical order, Cladocera, including water-flers. The sub-classes Ostracoda and Copepoda contain a large variety of usually small marine forms. These, with the Branchiopoda and Cirripedia, were formerly grouped as one heterogeneous sub-class, Entomostraca. Sub-cl. Cirripedia: degenerate, parasitic types. Barnacles (1 369): Sacculina (f.-i.).

Sub-cl. Malacostraca: have 20 or 21 body segments; most types have eyes on stalks. Principal order: Decapoda ("ten-footed"). Five segments of thorax have walking legs; have strong pincer-like grasping claws (chelne).

Sub-ord. Macrura: abdomen large, long. Typical families: Homaridae, lobsters (4-583); Crangonidae, shrimps (7 44); Palaemonidae, prawns (7 44); Astacidae, crayfish (2 526); Paguridae, hermit crabs (2-523 illus.)

Sub-ord. Brachyura: true crabs (2 523); abdomen short or rudimentary; includes common crabs, spider crabs, and land crabs.

Class ARACHNIDA (Scorpions, Spiders, Mites). Cephalothorax (fused head and thorax) bears six pairs of appendages, the first two used for grasping, last four pairs as legs. Land forms have either lungs, or tracheae (tubes passing air through the body), or both. Among extinct members of this class are grouped the trilobites and eurypterids. The king-crabs, **Xiphosura** $(f,\cdot i.)$, are grouped here rather than in the Crustacca. Apart from these, there are generally considered to be two subclasses:

Sub-cl. Pectinifera; possessing a pair of pectinei or combs formed from abdominal appendages; tail-end of body elongated.

Ord. Scorpiones, scorpions (6 509)

Sub-cl. Epectinata: no pectines, rear end not clongated.

Super-ord, Caulogastra: abdomen constricted from cephalothorax by narrow waist or "pechele,"

Ord. Pedipalpi: whip-scorpions.

Ord. Araneae: spiders (7 132); have silk glands (spinnerets). Typical families: Theraphosidae or Mygalidae, including "bird-eating" spiders and trap-door spiders; Lycosidae, wolf spiders, taran tula (7 227); Argyronetidae, water spider (7 134; 5 335 illus.); Attidae, leaping spiders; Argiopidae or Epeiridae, including common garden spiders; Agelenidae, labyrinth spiders.

Super ord, Pseudoscorpiones: no "warst," silk glands open on to mandibles. "Bookscorpions."

Super-ord. Phalangiomorphae: Includes Phalangidae, "harvest men," with pill-like body, long slender legs.

Super-ord. Rhyncostomi: Order Acari: mites. Abdomen fused with cephalothorax: mouth formed into sucking beak. Include-red mites, water mites, ticks, "itch" parasites, cheese mites, folliele mites: Fam. Eriophyidae are the gall-mites of plants.

Class DIPLOPODA (Millipedes).

Body cylindrical, divided into numerous segments, each two segments covered by single plate, making it appear as if two pairs of legs spring from each segment (hence "Diplopoda," meaning double footed); internal anatomy differs markedly from that of centipedes.

Class CHILOPODA (Centipedes).

Contipedes (2-291) resemble insects except for numerous segments of body and many legs. Note: Some authorities retain a class Myriapoda, which includes millipedes in sub-class Diplopoda and contipedes in sub-class Chilopoda.

Class HEXAPODA or Insecta (Insects). The insects (4 264) are distinguished from other Arthropoda by having (in the final stage) 3 pair-of legs. Head, body, and abdomen are separate they breathe by tracheae (air tubes). The manner in which the young develop leads to a division of insects into two sub-classes: (1) Apterygota; (2) Pterygota.

Sub-cl. Apterygota: new-born young closely resemble parents. Orders: Thysanura, primitive, wingless forms, including Machilis, the

"silver-fish"; Collembola, the spring tails.

Sub-cl. Pterygota, with two divisions: Division 1. Exopterygota: young (nymphs) superficially resemble parents, but with wings undeveloped; some orders show partial metamorphosis (f.-i.).

Ord. Orthoptera: "straight-winged," the front pair stiffened into covers; mouth adapted for biting and chewing. Includes three sub-orders: (1) Cursoria or "runners" such as cockroaches (2-439; 4-269 illus.); (2) Gressoria or "walkers" such as mantis (5 116); stick insects (4-265 illus.; 6 296 illus. f.); and leaf insects (4 266; 6 296 illus. f.); (3) Saltatoria or "jumpers" such as grasshoppers (4-64), locusts (5-14), and crickets (2 531); also the mole cricket (2-531).

Ord. Dermaptera: front wings hardened into covers but wings sometimes absent; tip of abdomen bears pincers. Typical family: Forficulidae, earwigs (3-154).

Ord. Plecoptera: stone flies; nymphs aquatic, with gills.

Ord. Ephemeroptera: consists of a single family Ephemeridae, may-flies (5–150).

Ord. Odonata: Aregon flies (3-112), strong biting jaws; nymphs aquatic.

Ord. Isoptera: social habits similar to ants, but otherwise different. White ants or termites (7 259; 1-661 illus. f.).

Ord. Embioptera: small, gregarious or emi-social insects.

Ord. Psocoptera (Corrodentia): very small forms, biting mouth parts. Single family Psocidae, book lice.

Ord. Anoplura: very small, flattoned, wingless forms; parasitic.

Sub-ord. Siphunculata, sucking mouth parts, lice.

Sub-ord. Mallophaga, biting mouth parts, bird-lice (6-78).

Ord. Thysanoptera: thrips; small forms with harry wings; sucking mouth.

Ord. Hemiptera: true bugs; mouth parts developed for piercing and sucking. Divided into sub-orders: (1) Heteroptera, fore and hind wings of different types, as in the water bugs, bed bugs; (2) Homoptera, all four wings similar, as in cicadas (2 387); aphids (1-182); scale insects (f.-i.); froghoppers (4-269 illus.); and cochineal (2 436).

Division 2. Endopterygota: young (larvae) undergo complete metamorphosis with resting (pupal) stago; illustrated in mosquito (5-271); butterfly (2-136).

Ord. Neuroptera: membranous, net-veined wings; usually carnivorous on other insects. Examples, ant-lions (1-178); lacewing flies (f.-i.); lantern flies.

Ord. Coleoptera: beetles (1-412); fore wings hardened as "elytra," wing-covers;

193

biting mouth-parts. Sub-ord. Adephaga includes ground beetles, tiger beetles, water beetles; all predaceous forms. Sub-ord. Polyphaga includes rest of beetles, in six super-families: (1) Staphylinoidea, rove beetles, devil's coach horse (f.i.); (2) Diversicornia: burying beetles; lndybirds (4-436); glow-worm (4-36); click beetles (1-414); "death-watch" (1-414); beetles (1-414); "death-watch" (1-414); (3) Heteromera, blister bootles, "Spanish fly"; (4) Phytophaga, loaf-cating beetles. long-horns, wood-borers; (5) Rhyncophora, weevils (7-435); (6) Lamellicornia, cockchafors; scarabs, dor beetles, stag beetles. Ord. Strepsiptera: minute forms, femaleparasitic on other insects; example, Stylops, the bee louse.

Ord. Mecoptera: scorpion flies; family Panorpidae; pupa free-living; transparent, net-voined wings.

Ord. Trichoptera: caddis flies; larvae aquatic, live in tubes of sand, stones or sticks.

Ord. Lepidoptera: butterflies and moths, (2-136). Scales on wings; larvae usually "caterpillars" (2-263).

Sub-ord. Homoneura: primitive forms, including swift moths (*Hepialus*).

Sub-ord. Heteroneura: venation of fore and hind wings different, not same as in Homoneura.

Super-fam. Cossoidea: goat moth, larva bores in trees.

Super-fam. Tineoidea: elothes moths; boll-worm of cotton, *Pectinophora*, etc. Super-fam. Pyraloidea: small forms, including *Ephestia*, flour moths.

Super-fam. Psychoidea: genus Zyq-aeuu, burnet moths.

Super-fam. Lasiocampoidea: eggar moths; vapourer; lackey moth (f.-i.) Super-fam. Noctuoidea: principally night-flying moths, including "cutworms" and "army-worms"; fam. Arctidae: "woolly-bears," tiger moths (2 143 illus.; 263 illus.).

Super-fam. Notodontoidea: puss-moth; hawk moths. Fam. Sphingidae; group Geometrina have "looper" larvae; winter moths (7-461).

Super-fam. Bombycoidea: Silk-worms (f.-i.); atlas moths (2-142 illus.).

Super-fam. Papilionoidea: all the butterflies. Fam. Papilionidae, swallow-tails (2–137, 138 illus., 263 illus.); Nymphalidae, peacocks, tortoise-shells, etc.; Pieridae, whites, etc.; Lycaenidae, blues; Argynnidae, fritillaries (f.-t.).

Note: The old grouping of the Lepidoptera into Rhopalocera, butterflies, and Heterocera, moths, was not founded on scientific evidence; nor is that adopted by collectors of dividing the order into Micro- (small) and Macro- (large) lepidoptera.

Ord. Diptera: true flies (3-401), distinguished by having only one pair of wings, the rear pair being represented by

"halteres," balancers. Two sub-orders: (1) Nematocera, forms with long antennae, larva has obvious head, includes fam. Tipulidae, daddy-long-legs (f.-i.); .fam. Culicidae, gnats (3-172), mosquitoes (5-271); and various families of midges. (2) Brachycera; antennae short, larva has no evident head; two groups, (1) Orthorrhapha, pupa free; horse flies, robber flies, bee-flies; (2) Cyclorrhapha, pupa enclosed in puparium; hover flies (4 267 illus.), house flies (4-264), and bluebottles; sheep ked or tick belongs to super-fam. Pupipara, in which larvae are born ready to pupate from body of female. The tsetse fly (7-823) also reproduces in this manner.

Ord. Siphonaptera (Aphaniptera); floas (8-388); wingless; larvae free-living, adults semi-parasitic, sucking mouth-parts.

Ord. Hymenoptera: four membranous wings; higher forms most highly developed of all insects. Has two sub-orders:

Sub-ord. Symphyla: sawflies (6 501), primitive types with no waist constriction. Sub-ord. Apocrita: with constricted waists; divided into seven super-families, first three of which are termed Parasitica, rost Aculeata, being armed with stings.

- Cynipoidea: gall flies (f.-i.). Lay eggs in plant tissue, producing "gall."
 Chalcidoidea: usually bright metallic colours; include fig wasps (8 351), but chiefly parasitic on other insects.
- 8. Ichneumonoidea: ichneumon flies (4 234); long, curved ovipositors, for laying eggs in larvae of other insects.
- 4. Vespoidea: wasps (7 423). Typical families: Vespidae, social wasps, including hornets (4-195): Eumemidae, solitary potter wasps (4 269 illus.); Ammophila, sand wasps: (7 424): Odynerus, mud wasp; Mutillidae, solitary, females wingless, ant-like, parasitic.
- 5. Sphecoidea: mud-dauber wasps; solitary types, usually preying on other insects.
- 6. Apoidea: boos (1-405); horey foeders. Typical families: Apidae, hive boes, tongue short, social life highly organized; Bombidae, bumble boes, tongue long, make "honey-pots" instead of combs; Megachilidae, solitary mason boes, lenf-cutter boes (f.-i.\, potter boes; Xylocopidae, carpenter boes (1-407, 409 illus., 269 illus.); Andrenidae, burrowing boes.
- 7. Formicoidea: ants (1-160); fermales differentiated into queens and workers; social life highly organized. Social ants form a single great family, Formicidae.

Phylum XIII. MOLLUSCA.

Molluscs (5-232): specialised mouth, eyes, gills or primitive lungs, digestive tract, heart and blood vessels, nervous system. Most forms have

"mantle" or fold of skin secreting shell on the outer surface.

- Cl. Amphineura: primitive types, especially the wormlike forms without shells. Shelled type, with eight plates, enabling animal to roll into ball, include chitons.
- Cl. Gastropoda: usually snail-like type-(5 232); conical or spiral shell; foot usually a creeping sole; primitive eyes; gills in water types, lungs in land types; heart, nerves, and muscles; rasp-like palate. The following is one of several classifications of this group:
 - Ord. Prosobranchia (Streptoneura): gilla Typical families: Patellidae, limpets (5–232 illus. f.; 7 24 illus. f.), ring-like gills Haliotidae, abalones, two comb-like gills. Haliotidae, secrete valuable purplish dye. Buccinidae, whelks, carnivorous; Cypraeidae, cowries, carnivorous; Ampullaridae, ampulla or "watering pot" shell; Littorinidae, periwinkles; Tritoniidae, Tritoniturret-like siphonated shells; Strombidae, foot narrow, soleless, conches, wing shellord. Pulmonata: lungs, consisting of cavity with network of blood vessel-Typical families: Helicidae, snails (7 73) Limacidae, slugs, shell reduced (7-73) Limacidae, pond snails.
- Cl. Scaphopoda: tooth-shells; mantle secrettusk-shaped shell; a small group.
- Cl. Lamellibranchiata (Pelecypoda): bivalves (7 24; 6 24); mantle divided along back hinged shells.

Ord. Filibranchia: gill juncture non vascular, ciliated. Typical genera: Matilus, mussels (2-437; 5-232; 7-24 illus. 1.4. Pecten, free-swimming, eyes on edge of mantle, scallops (6-502).

Ord. Eulamellibranchia: gill juncture vacular. Typical genera: Ostrea, oysters (6 23); Cardium, cockle (2 437); Veneros. Mya, clams (2-437; 7-24); Teredo (f.-). boring types, shipworm; Unio, Anodow, fresh-water mussels.

Cl. Cephalopoda (3-12; 4 370; 5 232): food bent under and joined to head; tentacles surrounding mouth; shell rudimentary ("cuttlebone") or absent. Bodily structure highly organized; well-developed eyes.

Sub-Cl. Tetrabranchia: Primitive forms, organs grouped in fours; genus Nautulus only living type (5-232); Ord. Ammonoidea, ammonites (5-232; 3-425 illus.), common fossils.

Sub-Cl. Dibranchia: organs grouped twos.

Ord. Decapoda: ten tentacles. Framples, Loligo, common squid (3-13). Sepia, cuttlefish (3-12); Architeuth signat squid (3-13). Ord. Octopoda: eight-armed. Typical families: Octopodidae, octopus (3-13). Argonautidae, argonaut or impaper not in the common square square

thus," female has boat-like shell (1-22).

Phylum XIV. POLYZOA (BRYOZOA).

Live in colonies resembling some Hydrozogus; sometimes called "sea moss"; entirely aquatic.

Phylum XV. PHORONIDEA.

Phylum XVI. GEPHYRAEA.

Phylum XV and Phylum XVI are two small phyla of marine creatures more highly evolved than those included in Phylum XIII (molluses).

Phylum XVII. BRACHIOPODA.

Have mollusc-like shells; Lingula, lamp shell, has not changed since Cambrian times, and is one of the oldest living creatures.

Phylum XVIII. ECHINODERMATA.

Literally, "spiny-skinned" animals: starfish and sea-urchins (7-150); internal structure, like 5-rayed star, with alimentary canal as axis; skin has limy plates; body has "arms" for locomotion. Circulatory system, muscles, nerves, and sense organs present. Typical classes: Crinoidea, sea lilies, mouth turned upward, arms branched and fringed, lower surface attached to bottom by stalk; Asteroidea, five arms, mouth on lower surface (genus Asterias, common starfish); Ophiur-oidea, brittle-stars; Echinoidea, sea urchins, globular; Holothuroidea, sea cucumbers (6-29), lmy plates embedded, leaving surface leathery; axis horizontal instead of vertical.

Phylum XIX. CHORDATA.

Body-wall cylindrical, usually with appendages (fins, wings, limbs, etc.). Body stiffened in primitive forms by gristly rod called a notochord, lying along spinal cord; in higher forms notochord develops vertebrae of bone, many of them supporting ribs.

- Sup ph. HEMICHORDA: Worm-like body; short spinal column, connected by nerve collar to another system along abdomen. Typical genus, Balanoglossus.
- Sub-ph. UROCHORDA: sea-squirts: usually have mollusc-like mantle or tunic containing cellulose; rudimentary heart.
- Sub-ph. CEPHALOCHORDA: body pointed at both ends; only appendage, tail fin; internal structure extremely primitive; very small fish-like creatures, swimming or lying buried in sand. Typical of this group is the genus Amphioxus, the lancelet (f.-i.).
- Sub-ph. VERTEBRATA (Craniata): vertebrates (7-894). Notochord in embryo of all true vertebrates, and remains as cartilaginous skeleton among the lower fishes: higher types develop true bony skeleton.

The sub-phylum Craniata includes all members of the animal kingdom not listed above.

Scientists believe that the first vertebrates were primitive fishes; that certain of these fishes gave rise to the amphibians; that certain of the amphibians gave rise to the primitive reptiles; and that from these in turn were evolved the reptiles, birds, and mammals.

The vertebrates are divided into six classes:
(1) Cyclostomata, lampreys, etc.; (2) Pisces, fishes; (3) Amphibia or Batrachia, amphibians; (4) Reptilia, reptiles; (5) Aves, birds;

(6) Mammalia, mammals. A detailed description of these classes, the most important in the animal kingdom, follows:

Class CYCLOSTOMATA (Lampreys, etc.). Sucker mouth instead of jaws; primitive cartilaginous skull, spine consists of chord and notochord rod. Lampreys (4-441) and hagfishes (6-78).

Class PISCES (Fishes).

All fishes (3-877) are water dwellers, and are especially adapted to this life; breathe with gills; skeleton structure varies from primitive notochord forms to highly organized bony forms. Of many classifications, that below is one of the simplest.

- Sub-cl. Elasmobranchii (Chondrichthyes): snout overhangs mouth; true jaws; skeleton cartilaginous; skin smooth with limy dots. Typical orders: Selachii, sharks (7-17), dogfish; Batoidei, skate and ray (7 58): torpedo-fish (7-294); sawfish (6-501).
- Sub-cl. Teleostomi (Osteichthyes): Fishes with well-developed jaws and skulls; body skeloton varies from partly cartilaginous to well-developed bony type.
 - Ord. Crossopterygii: fins have bony axis, fringed with spines or rays. Numerous fossil types; two living African genera. These primitive fish, the "fringe-finned ganouls," are important because they are believed to belong to the ancestral stock of all the higher vertebrates.
 - Ord. Dipneusti (Dipnoi): lung-fishes (5-51): gristly skeleton; swim bladder has unusually rich lining of blood-vessels and serves as primitive lung when fish are out of water. Numerous in Palaeozoic times; few living types.
 - Ord. Ganoidei: the ganoids. Skoletons vary between primitive (cartilaginous) and advanced (bony) types; skin covered with bony places, almost scale-like in some types. Typical sub-orders: Chondrostei, including sturgeon (7-174); Holostei, including garpike and bowfins.

Ord. Teleostei: bony fishes; well-developed skeleton and scales; divided conveniently into following sub-orders:

- 1. Malacopterygii (Physostomi): fin-rays soft. Following principal families: Salmonidae, salmon (6 489), trout (7-319), char, smelt, grayling; Scombresidae, flying fish (4 304); Clupeidae, herring (4-171), sprat, sardine, etc.
- 2. Apodes: ecls (8-170), pelican fish.
- 3. Haplomi: genus *Esox*, pike (6-200).
 4. Ostariophysi: a very large and various group; families include Cyprinidae, carp (2-245), roach (6-403), dace (6-404), bream (2-54), goldfish (4-41), minnow, etc.; Blennidae, blennies, catfish (2-264); electric eel; suckers.
- 5. Thoracostei: includes sticklebacks (7-157): sea-horses (6-524).
- 6. Anacanthini: soft-finned types; fam. Gadidae, cod (2-442), haddock (4-115), pollack, etc.; fam. Pleuronectidae, in-

eludes most of the flatfish, plaice, sole, halibut (4-119), turbot, flounder, etc.

7. Acanthopterygii: bony spines in fins.

A very large group comprising many different forms. Percidae, perch (6-128), bass (1-880); sea bream; gurnards; dragonet (8-112); angler fish; angel fish. Scombridae, mackerel (5-64); tunny (7-328); swordfish (7-215); mullets; lumpsucker.

8. Plectognathi: highly specialised forms; sunfish (7-190).

Note: There is very little agreement between authorities on the classification of fishes. Some, for example, rank these sub-orders as orders; others place the flatfish in an order of their own; others, again, place the catfish group in the Acanthopterygii, and confine the Ostariophysi to the carp group. The classification given is intended to give an idea of the main relationships.

Class AMPHIBIA (BATRACHIA) (Amphibians).

The amphibians mark an intermediate stage between fishes and reptiles. As their name indicates (amphi, on both sides, bios, life), they are fitted for life in water and on land. The typical amphibians undergo metamorphosis; that is, they hatch from the eggs as gill-breathing larvae (tadpoles, for example) which then develop into lung-breathing adults. There are, however, exceptions to this rule. The fins of the fishes are in the amphibians replaced by legs; the skin is soft and glandular; heart is three-chambered. In former geologic periods amphibians were abundant but to-day there are few species.

Ord. Caudata or Urodela: tailed forms; types able to regenerate lost parts. Includes salamanders (6-488) and newts (5-407).

Ord. Eucadata or Anura: tail-less forms. Typical sub-orders: Aglossa, tongue degenerate, such as pipa toad; Phaneroglossa, tongue developed, including toads (7-286) and frogs (3.472).

Class REPTILIA (Reptiles).

The reptiles (6-388) have no larval stage; skeleton specialised for land life; four-chambered heart; aquatic forms breathe at surface; skin covered with scales or bony plates. The most primitive reptile stock (3 510) is believed to have evolved two great branches. The first, springing from Theromorphodont stock (see sub-class Theromorpha below) gave rise to the first mammals and various specialised reptiles of which the turtles are highest. The second branch came from stock of which the tuatara or Sphenodon is a living example, and gave rise to the first birds and specialised reptiles, of which the crocodiles, snakes, and lizards are the living forms. These two great groups are marked "Evolutionary Group A" and "Evolutionary Group B."

Evolutionary Group A.

Sub-cl. Theromorpha: varied extinct forms, with many skeletal details and teeth transitional between amphibia and mammals.

Sub-cl. Plesiosauria: plesiosaurs (6-282, 283 illus.). Extinct forms; long necks, paddle limbs; comparatively slow-moving, aquatic types.

Sub-cl. Ichthyosauria: ichthyosaurs (6-282, 283 illus., 1-159). Extinct forms; short necks, toothed beaks, swift-moving, whale-like forms, exclusively aquatic; bore living young.

Sub-cl. Chelonia:

Ord. Chelonia: tortoises and turtles (7-294; 6-388 illus.). Toothless, horny beak; body protected by bony caso; limbs developed for walking or swimming. Divided into two sub-orders: (1) Athecae, shell leathery, including leathery turtles; (2) Thecophora, shell hard, including land tortoises and all the remaining turtles.

Note: The Order Chelonia of this classification is divided by some authorities into two Orders of which Testudinata contains tortoises and Chelonida turtles.

Evolutionary Group B.

Sub-cl. Prosauria: Typical sub-order is Rhynchocephalia, of which the tuatara or Sphenodon (4-530) is the only living representative. First birds may have developed from prosaurian stock.

Sub-cl. Pterosauria: Extinct flying reptiles, in wing development like bats. Typical order Pterodactyli, the pterodactylis (6–281), Ptera nodon (6–281, 282 illus.).

Sub-cl. Dinosauria: Extinct: represented by several prehistoric monsters. Some had bird-like features (hollow bones, etc.), but birds already existed when those formflourished.

Sub-cl. Crocodilia:

Ord. Crocodilia: differ from other reptiles chiefly in skull structure. Crocodiles (2 532; 4 173) and alligators (1-113, 157 illus.).

Sub-cl. Sauria: lizards and snakes. Differ from other reptiles chiefly in structure of skeleton.

Ord. Ophidia: snakes (7–74). Lack limbs; halves of lower jaw connected by elastic tissue. Anaconda (f.-i.), boa constrictor (7-74, 75 illus.), python (6–315), cobra (2 436; 7–75 illus.), vipers (7 402), rattle snake (6–366), grass-snake (4 65)..

Ord. Lacertilia: lizards (4-528); limbs usually developed and functionar; halves of lower jaw fused solidly together. Divided into three sub-orders: (1) Lacertae, most typical lizards, including common lizards, iguanas (4-235; 3-413 illus.), Komodo dragons (3-112; 4-529), horned toad (4-530), Gila Monster (4-530, 528 illus.). flying lizard, slow worm (7-70; 4-529). (2) Geckones, the geckos (4-529; 3-413 illus.). (3) Chameleontes, chameleons (2-301; 3-333 illus.).

Note: Some authorities place snakes and lizardin Order Squamata, divided into Sub-order-Ophidia (snakes) and Lacertilia (lizards).

Class AVES (Birds).

The skeleton of a bird resembles the reptile type, save in modifications for flying: the skin produces feathers (3 344); there is a four-chambered heart; teeth absent in living forms; all organs show adaptations for flying, evolved from reptile stock, after unsuccessful experiments such as Pteranodon (6 281, 282 illus.). Read first general articles on birds (1-453) and on eggs (3 172).

Sub-cl. Archaeornithes: extinct forms, possossed teeth; Archaeopteryx (6 282; 1-453 illus.).

Sub-cl. Neornithes: three super-orders: (1) Odontognathae, fossil forms such as Hesperornis. (2) Palaeognathae (Ratites), a heterogeneous group that have lost the "keel" to the breast bone and are flightless. Various orders, represented by Struthio, ostrich (6 8: 1-471 illus.; 3-413 illus.) two-toed, Old World; Rhea (7 97 illus.), three-toed, New World; Casuariiformes, cassowary (1-312; 6 9), omus (8 242: 1-315 illus.), Australian; Dinornis, mon (f.-i.), New Zealand; Apteryx, kiwi (1 186: 1-471 illus.), New Zealand; tinamous, S. America. (3) Neognathae (Carinatae): all the normal birds; breastbone has a keel tor attachment of flying muscles.

Ord. Spheristromes: penguins (6 115, 117 illus. f.).

Ord. Gaviiformes: loon (f.-i.), divers (f.-i.). Ord. Colymbiformes: grebes (4 69; 1 471 illus.).

Ord. Tubinares or Procellariiformes: albatross (1-92), shearwaters (7-20), petrels (6 146).

Ord. Pelecaniformes; polican (6 108; 1 471 illus.), gannet (3 502), shag (7 11; 1 469 illus.), cormorant (2 506; 2 367 illus.), frigate-birds (3 471).

Ord. Ciconiiformes: Sub-ord. Ardeae, heron (4 170; 7-169 illus.), bittern (1 476), egret (7 168). Sub-ord. Balaenicipites, shoobill (7-166, 169 illus.). Sub-ord. Ciconiae, stork (7-166), ibis (7 168 with illus. f.), spoonbill (7-168, 169 illus.). Sub-ord. Phoenicopteri, flamingo (3-385, 413 illus.). Ord. Anseriformes: ducks (3-130), geese (4 46), swan (7 198).

Ord. Falconiformes: condor (2 479), vultures (7-407), adjutant bird (1-20), hawks and falcons (4-140), turkey buzzard (2 147), eagle (8-145; 1-157 illus.), secretary bird (6 528), buzzard (2 146), kite (4-415).

Ord. Galiiformes: game birds and poultry (6 277) grouse (4 99), partridge (6-93), peacock (6-100), pheasants (6-153), guineafowl (4-104; 1-66 illus. f.), turkey (7-332), quail (6-316).

Ord. Gruiformes: crane (7-168), rail (6-353), moorhen, coot, and cornerake (5 204 illus. f.).

Ord. Charadriiformes: waders (7-408), oyster-catcher (6-227; 1-468 illus.), plover (6-226; 1-471 illus.), snipe (7-75), woodcock (7-468), avocet (6-227), phalarope (1-470). Sub-ord. Lari includes gulls (4-105), terns (7-260), skua gulls (1-169).

Sub-ord. Alci includes auk (1-309), guillemot (1-309), razorbill (1-309), puffin (6-302), Ord. Columbiformes: dodo (3-100), pigeons and doves (6-197).

Ord. Cuculiformes: euckoo (3 7).

Ord. Psittaciformes: parrots (6 92), macaws (5-61), cockatoos (2-487); budgerigars (6-92).

Ord. Strigiformes: owls (6-11).

Ord. Caprimulgiformes: nightjars (5-488). Ord. Cypseliformes or Micropodiformes: swift (7 198), humming-birds (4-203; 7-132 illus. f.).

Ord. Coraciformes: kingfisher (4 404), hornbill (4 195).

Ord. Piciformes: toucan (7-801, 97 illus.), woodpeckers (7 468), wryneck (f.-i.).

Ord. Passeriformes: the highest birds, including all the song birds. In general, adapted for perching; named from passer, sparrow in Latin. Below is set out a list of the most important of the families in the Ord. Passeriformes:

Menuridae: lyre-bird (5 55; 6-76 illus. f.). Aludidae: lurks (4 447).

Hirundinidae: swallows and martins (7 197).

Corvidae: crow (2-586), rook (6 449), raven (6 366), jay (4-357; 1-467 illus.), magpie (5 86; 1-467 illus.), jackdaw (4 333).

Ptilinorrhyncidae: bower-bird (2-28).
Paradiseidae: birds of paradise (6-76,

77 illus. f.).

Paridae: tits (7-285). Sittidae: nuthatch (5 486).

Certhiidae: tree-creoper (5-486).

Cinclidae: dipper (f.-i.).

Troglodytidae: wren (7-500).

Turdidae: thrushes (7-271; 1-153 illus.), blackbird (1-477), robin (6-415), nightingale (5-436), wheatear (7-448), stone-and whin-chats (7-448), orioles (6-4), hedge sparrow (7-123).

Sylviidae: warblers (7-418).

Regulidae: gold-crest (1-459 illus.).

Muscicapidae: flycatchers (3-402).

Motacillidae: wagtails (7-409), pipits (6 205).

Laniidae: shrikes (7-43).

Sturnidae: starling (7-151; 1-469 illus.).

Ploceiidae: weaver-birds (f.-i.).

Thraupidae: tanager (f.-i.).

Fringillidae: finches (3-852), cardinal bird (f.-i.), buntings (2-124), cross-bill (3-352), canary (2-207), linnet (4-515), sparrow (7-123), chaffinch (3-382).

Class MAMMALIA (Mammals).

The mammals (5-100) include all vertebrates which have true hair (4-417) and the young of which are nourished by their mother's milk. The class is here subdivided into three sub-classes according to the degree of development of the young at the time of birth. It is generally believed

by scientists that mammals evolved from reptile or amphibian stock, although the course of evolution is uncertain. The earliest known mammals lived at about the same geological period as the giant reptiles and the first birds.

Sub-cl. Prototheria: primitive types; lay eggs and hatch young; one living order, Monotremata. Includes duckbill (3-133) and spiny ant-eaters (1-170; 3-133).

Sub-cl. Metatheria: young born alive but not perfectly formed; development completed in a skin-pouch on mother's body. One living order, Marsupialia, divided into two sub-orders: (1) Diprotodonta, teeth adapted to vegetable food: includes wombats, phalangers (5-137), kangaroo (4-391), koala (4-424; 1-315 illus.); (2) Polyprotodonta, teeth adapted to animal food: includes opossums (5-521), Tasmanian devil and Tasmanian wolf (7-229; 5-137), bandicoots (5-137).

Sub-cl. Eutheria (Placentalia): young completely developed when born; includes all other mammals.

Group Unguiculata.

Ord. Insectivora: The most primitive of the higher mainmals; teeth suited for eating insects; feet plantigrade (sole-walking); most types nocturnal. Includes tree shrews (placed by some authorities in the Primates), elephant (or jumping) shrews, moles (5–231), shrews (f.-i.), hedgehogs (4–152).

Ord. Dermoptera: flying lemurs; curious Malayan forms, with affinities to Insectivora, bats, and lemurs. Only two species are known.

Ord. Chiroptera: bats (1-880); fore-limbs winged; internal structure modified for true flight. Typical sub-orders: (1) Megachiroptera, teeth adapted to fruit-eating, flying foxes (1-382); (2) Microchiroptera, adapted to eating insects or sucking blood; includes vampire bats (1-382), and all the British bats.

Note: Many older authorities place the order Primates in a group separated from the other orders; they are here included with orders showing some affinities, following the grouping of G. G. Simpson (f.-i.).

Ord. Primates: five-fingered hands and five-tood feet, with nails; eyes directed forward.

Sub-ord. Prosimii or Lemuroidea: lemurs (4-478). Face long and fox-like; tails not suited for grasping.

Sub-ord. Anthropoidea: face rounded, cranium comparatively high; internal organs more highly developed than in lemurs. Divisible into: (1) Platyrrhina, New World types, nostrils far apart, tail often prehensile, three pairs of premolar teeth in each jaw; (2) Catarrhina, Old World types, nostrils close together, tail never prehensile, two pairs of premolar teeth in each jaw. First two families are New World types, remainder Old World:

Fam. Cebidae: New World monkeys (5-240) with opposable thumbs, more or less naked ears, and flat or curved nails.

Fam. Hapalidae: marmosets (5-240 illus. f.). Thumbs not opposable, nails clawlike.

Fam. Hylobatidae: gibbons (4-18). long-armed, tailless; thumb short, backbone without S-shaped curve.

Fam. Cercopithecidae: Old World monkeys (5-240), including baboons (5-241), mandrill (5-242). Wedge-shaped chest; arms shorter than legs, tail usually present.

Fam. Similate or Pongidae: higher apes (1-179). Broad chest; arms longer than legs, but shorter than in gibbons; S-shaped curve of backbone partially developed; prominent canineteeth; jaws not curved at sides as in Man; cerebrum smaller than in Man. Includes orang-utan (5-526), chimpan zee (2-360), gorilla (4-48).

Fam. Hominidae: the human type. Single living genus, with one living species—Homo sapiens, Man (5-104).

Ord. Edentata: toothless or with rudimentary teeth in rear of jaw; exceedingly varied types. Two sub-orders: (1) Pilosa, hairy types, including sloths (7-68; 2-45 illus.), ant-eaters (1-170); (2) Dasypoda, armoured types, including armadilloes (1 241).

Ord. Pholidota: true scaly ant-eaters or pangolins. Covered with horny, overlapping scales.

Group Glires.

Ord. Rodentia: rodents (f.-i.); teeth and jaws adapted to gnawing. Single pair of incisors in upper jaw; families differ in skull structure and dentition. Includes squirrels (7-140), chipmunk (2-377), prairie dogs (f.-i.), marmots (3-496), beavers (1-399), kangaroo rats, dormice (3-107), jerboas (4-361), hamsters (f.-i.), vole (f.-i.), lemmings (4-477), musk-rats (5-310), rats (6-365) and mice (5-288), porcupine (6-260), guinea-pig (4-105), capybara (f.-i.), chinchilla (2-377).

Ord. Lagomorpha (by some authorities retained as Sub-order Duplicidentata of Order Rodentia). Two pairs of incisors in upper jaw. Includes hares (4-134) and rabbits (6-327), agouti (1-68).

Group Mutica or Cetacea.

Order Cetacea (mammals with flippors) (5-103).

Sub-ord. Odontoceti: toothed whales (7-445); includes sperm-whales, dolphins (3-105), porpoises (6-265), grampuses, and narwhals (f.-i.).

Sub-ord. Mystacoceti: whalebone (or baleen) whales (1-164), right whales. rorquals (7-445, 446 illus.), humpback whales (7-446 illus.).

Group Ferungulata.

Ord. Carnivora: flesh-eaters, though some forms are omnivorous and one or two entirely vegetarian. Teeth and skeletal structure adapted to seizing and killing prey. Divided into sub-orders according to internal structure.

Sub-ord. Fissipeda:

Fam. Canidae: dogs (3-100), dingo (1-312; 3-103), wolves (7-464), coyotes, jackal (4-383), fox (3-426). In all these there are special adaptations to running down prey; feet digitigrade. Fam. Ursidae: bears (1-390); teeth adapted to partly vegetarian diet; feet plantigrade.

Fam. Procyonidae: raccoons (6 328); feet plantigrade, but usually arboreal creatures. The pandas (6 59) come between the raccoons and the bears. They are vegetarian and have plantigrade feet.

Fam. Mustelidae: weasel family, a highly successful group of very active, carnivorous forms, most of them small; feet partly digitigrade, body long and slender. Marten (5-137), stoat (6-296), weasel (7-433), polocat (f.-i.) and ferret (3-348), mink (5-221), wolverine, skunk (7-64), badger (1-345), otter (6-10; 4-209).

Super-Fam. Feloidea:

Fam. Viverridae: civels, etc., with the Sub-fam. Herpestinae: mongooses (5-239).

Fam. Hyaenidae: hyenas (4 222).
Fam. Felidae: cats (2 261). Very highly specialised for predatory habit.
Domestic cats, jaguar (4 336), leopard or panther (4 484), lion (4 520, 1 61 illus.), ocelot (4-484; 2-263), puma (6-304; 5-455 illus.), tiger (7-276), lynx (5 54), cheetah (1-60 illus.).

Sub-order Pinnipedia:

The Pinnipede series contains three families: Otariidae, in which are the sealions and fur-seals (6 525): Odobaenidae, containing the walrus (7-417); and Phocidae, the true seals (6-528), seaclephants (6-536).

Ord. Tubulidentata: aardvarks (1-2). Tubular snout, large number of lumbar vertebrae.

Note: The following Orders have by some authorities been grouped together broadly as Ungulata.

Ord. Proboscidea: nose and upper lip extended to form trunk. Elephants (8 225), mammoths and mastodons (5-103).

Ord. Hyracoidea: some unique skull features; cheek teeth like those of rhinoceros; in size and habits like hares. Hyrax or rock-rabbit (5–100 illus.).

Ord. Sirenia: aquatic mammals with flippers; cat vegetable food, in contrast with Cetaceans (see Group Mutica or Cetacea) and the seals (see Ord. Carnivora); internal structure indicates descent from ancestor of Proboscideans. Includes sea-cows (5-396), manatees (f.-i.), and dugongs.

Ord. Perissodactyla: hoofed animals, usually odd-toed; where toes are even in number, they are not symmetrical about the vertical plane of the hoof.

Fam. Equidae: foot structure highly evolved, teeth unusually long. Includes horse (4-196), ass (1-275), zebra (7-522). Fam. Tapiridae: tapirs (7-227); have proboscis, small tusks, and simple teeth; front foot has four toes.

Fam. Rhinocerotidae: rhinoceroses (6-392).

Ord. Artiodactyla: hoofed animals, usually even-tood; odd-tood types have digits symmetrical about the vertical plane of the hoof.

Sub-ord. Suina: lower leg not fused into cannon bone; upper incisor teeth always present, often tusked. Stomach varies from ample to ruminant type.

Fam. Suidae: pigs (6-196), wild boar (1 496), wart-hog (7-420). Snout has fleshy button, tusks of male curve upwards; stomach simple; four toes on each foot, outside two off ground. Fam. Tayassuidae: peccaries (f.-i.). Tusks small, point downward; front feet have four toes (two not touching

ground) and rear feet only three. Fam. Hippopotamidae: hippopotamius (4-179). Muzzle broad, rounded; stomach complex; all four toes touch ground.

Sub-ord. Tylopoda; feet have large, cushioned pads; stomach complex but not completely ruminant. Typical family. Camelidae, camels (2 183), alpaca (1 119), llama (4 580).

Sub ord. Pecora: true ruminants (" cudchewers").

Fam. Giraffidae: giraffes (4 21). Adapted to browsing; solid-horned. Also the okapi (f.-i.).

Fam. Cervidae: deer (3-59; 5-433 illus.); antiers solid-horned, shed annually. Caribou (2 242), moose (5 260), musk deer (5 309), reindeer (6 379), wapiti (8-60; 5-455 illus.).

Fam. Antilocapridae: American antelope or pronghorns; hollow horns growing from bony cores and shed annually.

Fam. Bovidae: includes cattle (2-273), buffalo (2-109), yak (7-511), sheep (7-20), goats (4-37), ibex (4-227, 37), bison (1-475), aurochs, musk ox (5-309), true antelopes (1-170), chamois (2 301), Rocky Mountain goat (1-171), gazelles (1-171, 60 illus. f.); permanent hollow horns growing from bony horncore.

BOOKS TO STUDY

IN connexion with our Study Outlines we give here a classified selection of books on the various subjects, recommended to those who wish to take their studies further. The books, which are obtainable from any good public library, are mostly selected with an eye to the requirements of younger readers, from about eleven years old and upwards, and the selection is closely based on the recommendations of the Library Association.

AGRICULTURE

In Search of Food. D. Clark
The Seasons and the Farmer. F. F. Darling
A History of Agriculture. T. B. Franklin
Round the Year on the Farm. A. G. Street
The Principles of Agriculture. J. R. Ainsworth
Davies

The Soil. Sir A. D. Hall

ARCHITECTURE

Sir Banister Fletcher's History of Architecture is a standard work that can be consulted at any time with profit and pleasure. A good shorter history is Architecture by W. R. Lethaby. The following are recommended for younger students:

Architecture for Children. Jane and Maxwell Fry How to Look at Old Churches. H. S. Stowell Exploring Old Buildings. E. V. Clark
A Little Book of Architecture. N. Jewson
The Observer's Book of British Architecture. J. Penoyre and M. Ryan
Other People's Houses. R. K. and M. 1. R. Polkinghorne

ASTRONOMY

A Guide to the Sky. E. A. Beet
Our Wonderful Universe. C. A. Chant
The Spangled Heavens. L. Edwards
Observing the Heavens. P. Hood
The Mysterious Universe. Str James Jeans

BIOLOGY

A Child's Biology, by Brian Vesey Fitzgerald, is recommended as a single approach to the subject, as is The Young Naturalists Discover Spring, by A. F. C. Hillstead. A comprehensive scientific but simply told account of evolution, from the time of the earth's formation to the New Stone Age, is When the World was Young, by M. McB. Morroll.

The following books present a few technical difficulties to the newcomer in Biology, but to the enthusiastic student they may well prove as fascinating as any story of travel and adventure. See also lists under BOTANY and ZOOLOGY.

Elements of Plant Biology. A. G. Tansley
Essays of a Biologist. J. S. Huxley
Life—Outlines of General Biology. Sir J. A.
Thomson and Sir P. Geddes
The Origin of Species. Charles Darwin
Mendel's Principles of Heredity. William Bateson
Man's Place in Nature. T. H. Huxley
The Origin and Evolution of Life. H. F. Osborn
The Science of Life (2 vols.). H. G. Wells, J. S.
Huxley, and G. P. Wells
Biology for Everyman, ed. Sir J. A. Thomson
Animal Ecology C. E. Elton
Animal Biology. Grove and Newell

BOTANY

A number of good books on British wild flowers are listed under NATURE STUDY and others of general interest to the Botany student will be found under Biology. The following are further useful books on various aspects of Botany:

Botany for Fun. G. H. Browning
Practical Plant Ecology. A. G. Tansley
A Pocket Book of British Trees. E. H. B. Boulton
A Book on Common Flowers. R. Bracher
Hayward's Botanist's Pocket Book
The Romance of the Fungus World. R. T. and W.
Bolfo

CHEMISTRY

Reference Book of Inorganic Chemistry. W. M. Latimer and J. M. Hildebrand
Outlines of Organic Chemistry. E. J. Holmyard
Everyday Chemistry. J. R. Partington
Fun with Chemistry. M. and I. Freeman
Chemistry Experiments at Home. H. L. Heys
The Young Chemist. F. Sherwood Taylor

GEOGRAPHY

Man the World Over. G. C. Carter and H. C. Brontnall
World Wealth in Maps. S. Harrop
Story Atlas. J. Sterling
The Lands of the Commonwealth. R. K. and M. I. R. Polkinghorne
Famous Voyages of the Great Discoverers. E. Wood
A Study of the Oceans. J. Johnstone

Also recommended are the various volumes in the Young Traveller series, which includes books on Ireland, Canada, Australia, India and Pakistan, Switzerland, the Netherlands, the U.S.A., China, etc.

HISTORY

There are, of course, countless works on History. The student is advised to read some general survey of world history such as The Outline of History or A Short History of the World, both by H. G. Wells, or the Universal History of the World (8 vols.), edited by Sir John Hammerton. A masterly short account is The Living Past, by F. S. Marvin. Younger readers will probably prefer I. O. Evans's Junior Outline of History, which is well recommended.

ANCIENT

When the World was Young. M. McB. Morrell
The Dawn of European Civilization. V. Gordon
Childe
Digging Up the Past. Sir C. L. Woolley
History of the Ancient Egyptians. J. H. Breasted
Babylonian Life and History. Sir E. Wallis Bridge

The Story of Greece. M. MacGregor The Story of Rome. M. MacGregor Everyday Life in the Old Stone Age, also New Stone, Bronze, and Early Iron Ages. M. and C. H. B. Quennell

Everyday Things in Homeric Greece, also Classical Greece. M. and C. H. B. Quennell

Classics that can always be consulted with profit melude Plutarch's Lives, Herodotus' History, and Gibbon's Decline and Fall of the Roman Empire; while the Cambridge Ancient History is a standard work of reference and scholarship.

MEDIEVAL.

In Feudal Times. E. M. Tappan
The Story of the Crusades. E. M. Wilmot-Buxton
The Holy Roman Empire. James Brice
Medieval Europe. H. W. C. Davis
Stories from Froissart. Ed. Sir H. Newbolt
Medieval People. Edeen Power

A standard work of reference and scholarship is the Cambridge Medieval History, ed. H. M. Gwatkın.

MODERN

History of Europe. H. A. L. Fisher Cambridge Modern History

BRITISH HISTORY

History of England. G. M. Trevelyan
English Social History. G. M. Trevelyan
Oxford Manuals of English History Ed. Su.
C. W. C. Oman
The Homeland Histories (6 separate vols.)
W. J. Claxton
Our Island Story. H. E. Marshall
Scotland's Story. H. E. Marshall
The Story of England. Sur Arthur Bryant
A Modern History of the English People (1880)
1922). R. H. Gretton

England 1870-1914. P. C. K. Ensor Everyday Life in Roman Britain. M. and C. H. B. Quennell

A History of Everyday Things in England (4 vols.) M. and C. H. B. Quennell

HOUSEHOLD SCIENCE

A good standard reference book forming a complete gude to the art of running a home is The Concise Household Encyclopedia. The tollowing books are recommended as specially suitable for younger readers. Judy's Book of Housework. M. Goaman

Judy's Book of Housework. M. Goaman
Judy's Book of Sewing and Knitting. M. Goaman
Judy's Cookery Book. M. Goaman
Cookery for Girls. M. G. Laskie

Needlework for Girls. I. Horner

INDUSTRIES AND APPLIED SCIENCES

Water Supply To-day. J. Bowman
Spanning Space (a book about bridges). C. A.
Claremont
The Story of Power. G. Gerard
Great Engines and their Inventors. G. S. Ranshaw
The Boy Electrician. J. W. Sims
How Radar Works. K. Ullyet
Railways for All. Ed. H. C. Webster

Rockets and Jets. Ed. R. B. Wav and N. D. Green Flight To-day. J. L. Nayler and E. Ower

Modern Motor-cars. C. Grant Man is a Weaver. E. C. Buity

Silk: its Production and Manufacture. L. Hooper Timber: From the Forest to its Use in Commerce. W. Bullock History and Development of Road Transport. J. Patterson

Books in the Commodity series include The Story of Oil, also of Steel, Plastics, Cotton, Wool, Rayon, Coal, and Rubber.

LITERATURE

Reference Book: The Cambridge History of English
Literature
English Literature for Boys and Girls. H. E. Marshall
Enjoying Books. G. Trease
Poetry for You. C. Day Lewis
The Golden Road in English Literature. Amy Cruss
Short History of French Literature. G. A. Sauntsbury
The Literature of Germany. J. G. Robertson
History of Italian Literature. Richard Garnett
History of Spanish Literature. J. Fitzmaurice-Kelly
An Outline of Russian Literature. Maurice Baring
History of Ancient Greek Literature. Gilbert Murray
Latin Literature. J. W. Mackail

In addition the vast field of literature itself should be studied, for the best of all ways of learning about great books is to read them. The student should make his own election from such series as Everyman's Library or The World's Classics. Famous anthologies of English poetry include The Oxford Book of English Verse, Palgrave's Golden Treasury, and the "collection of thymes and poems for the young of all ages" made by Walter Do la Mare, entitled Come Hither. Modern Verse for Young People, ed. M. Wilhams, is a useful introduction to modern poetry. The English Men of Letters series provides excellent short biographies of all the greatest English writers.

MUSIC

The standard work of reference is Grove's Dictionary of Music and Musicians, available at most good reference libraries; but a valuable reference work for the home is The Oxford Companion to Music, ed. by P. A. Scholes.

Listening to the Orchestra. K. Barno
The Instruments of Music. R. Donington
Going to a Concert. L. Salter
The First, Second, and Third Books of the Great
Musicians (3 separate vols.) P. A. Scholes
Music is for You. P. M. Young

MYTHOLOGY

The Heroes. Charles Kingsley
The Wonder Book. Nathaniel Hawthorne
Tanglewood Tales. Nathaniel Hawthorne
Legends of Greece and Rome. G. H. Cupfer
The Iliad, trans. by E. V. Rieu
The Odyssey, trans. by E. V. Rieu
The Children's Iliad. A. J. Church
Che Children's Aeneid. A. J. Church
Asgard and the Norse Heroes. K. F. Boult
Told by the Northmen. E. M. Wilmot Buxton
The Fall of the Nibelungs. M. Armour

NATURE STUDY

Outline of Nature in the British Isles, ed. Sir John Hammerton, is a comprehensive work in 3 volumes with hundreds of excellent photographs. There are also various helpful series well worth collecting for your bookshelf in separate volumes. Examples are the Wayside and Woodland series, consisting of books on Birds, Animals, Butterflies and Moths, Spiders, Bees and Wasps, Fishes, Ferns, Trees, and Flowers.

BOOKS TO STUDY

Nature study books in the popular Observer's pocket series include handy books on British Birds; Wild Animals; Fresh-water Fishes; Grasses, Sedges, and Rushes; etc. The Shown to the Children series, suitable for very young students, includes volumes on Birds, Flowers, Butterflies and Moths, Bees, the Seashore, etc.

The following are recommended individual works: The Young Naturalist. Sir J. Buchan-Hepburn The Book of the Countryside. F. M. and T. Duncan The Open Book of Wild Life. R. Morse Nature Rambles (4 separate vols., Spring, Summer, Autumn, Winter). E. Step Trees and Shrubs of the British Isles. N. B. Hodgson Wild Flowers at a Glance. M. C. Carey and D. Fitchew Neptune's Garden. L. R. Brightwell Life on the Seashore. E. A. R. Ennion Shell Life. E. Step The Fishes of the British Isles. J. T. Jenkin

The Pond People. L. R. Brightwell Aquariums. A. Evans Insects of the British Isles. N. B. Hodgson The Pocket Guide to British Birds. R. S. R. Fitter

The Naturalist on the Seashore. E. M. Stephenson

and R. A. Richardson And you might also like to possess two "classics" of the subject, The Natural History of Selborne, by Gilbert White, and The Charm of Birds, by Viscount Grey of Falloden.

PAINTING

Bryan's Dictionary of Painters and Engravers The Story of Painting. Agnes Allen The Paintbox. Martin Armstrong Famous Paintings. A. E. Chase Enjoying Painting. A. C. Ward The Outline of Art. Ed. by Sir W. Orpen

PHYSICS

Physics for Everyone. E. F. Carter Romping through Physics. O. W. Gail Fun with Mechanics. H. McKay The Tricks of Light and Colour. H. McKay Conquest of the Atom. R. D. Potter Atomic Power. R. Barnard Way Matter, Energy, and Radiation. J. R. Dunning and H. C. Paxton Text-Book of Physics. J. Duncan and S. G. Starling

Human Growth. L. F. Beck and M. Robinson An Active Human Biology. C. Bibby The Food We Est. B. and M. Holmes How You Work. I. Wilson

SOCIAL SCIENCES

SOCIOLOGY

This list is necessarily restricted to a few standard works on the whole subject. A library catalogue will provide students with the titles of many books on the hundreds of different minor aspects of Sociology.

Principles of Sociology. L. T. Hobhouse The Social Contract. Rousseau Sociology: the Psychology of Society. M. Ginsburg Social Psychology. K. Young A Study of History. A. I. Toynbee Plato's Republic More's Utopia

ECONOMICS

Your Work and Wages. C. Furth and S. Graves The Money Book. A. Groom

Everyday Economics. R. R. Martin

"Classics" of the subject, with which the serious student should quickly make some acquaintance, include the following:

The Wealth of Nations. Adam Smith Principles of Political Economy and Taxation D. Ricardo Principles of Political Economy. J. S. Mill Capital. Karl Marx

CIVICS

The Story of Our Parliament. A. Allen You and the State. C. Furth Young Citizens: Simple Civics for Boys and Girls K. Gibberd

ZOOLOGY

Mammals in Britain. M. Blackmore Animals of the British Isles. H. Cory The Animal's World. D. L. Mackinnon World Natural History. E. G. Boulenger How Birds Live. E. M. Nicholson The Invertebrata. Borradaile and Potts

Interest-Questions on Many Subjects

What supports an aeroplane in the air? 1-38. Why is the sky blue? 1-81. Who was the first man to go up in a balloon? 1-354 What makes the water spurt up in an artesian well? 1-255 What part of your weight is blood? 1-489. Why did the Ancient Egyptians put straw in their bricks? 2-57 Does a compass needle point exactly north? 2-475. Where is most of the world's amber obtained? 1-131. Why is the outer rail of a railway track raised higher than the inner rail at a curve ? 2-203 How do feathers grow? 3-314. How does the sarthworm help the farmer? 3-153 Why does a dog turn round before lying down? 3-100. Why must a deep-sea diver come up slowly? 3-05. Why does dow not form on cloudy nights? 3-82. Why does cork float? 2-505. What was the first metal worked by Man? 2-502. What metal was named after a mischievous gobiln? 2-434. Why does phosphorus shine in the dark? 6-162.

What gas was discovered on the sun before it was found on the earth? 4-160 Why does a stick look bent in water? 4-498. How did "pig tron" get its name? 4-293 What gives fireworks their colours? 3-360. What people used baskets for carrying water? 1-38 Why does a piece of iron get hot when it is hammered? Why must safety matches be struck on the box? 5-14 Why, if mercury is a liquid, will it not wet paper? 5-173. What plants eat animals? 6-217 plate f. If you plant a seed upside down, will the root grow upward instead of downward? 6-217 How many earthworms are there in an average acre of sell? 3-151 What animals have four stomachs? 2-273 How does a potter 'throw "a vase? 6-274. What animal has a hide over an inch thick? 4-179. From what fish are carriare and isingless obtained? 7-174. How fast can a homing pigeon fly? 6-198. How far can a rattlesmake reach when it strikes? 6-866. Where do crabs alimb trees? 2-524,

Easy Reference

FACT-INDEX

A Guide to the Contents of Volumes 1-7 with Thousands of Additional Facts and Figures

How to Use the Fact-Index

THE Editor has stressed in the opening pages of each of the seven earlier volumes that whenever your immediate object in using THE BOOK OF KNOWLEDGE is to acquire a particular item of information, you should first refer to this FACT-INDEX. If the information is recorded anywhere within the first seven volumes, the FACT-INDEX will tell you where to find it; or it may directly yield the information you require—for a very large proportion of its entries give briefly the essential facts about a subject.

In indicating to you where to find information elsewhere in The Book of Knowledge, the number of the volume is given first in black-face type, followed by the page number in that particular volume. Thus the reference 5–320 would mean that you should look in Volume 5 and turn to page 320. When the Fact-Index refers you to the main article on a given subject, the page number is also given in black-face type, thus: 7-245—meaning that the chief information about the subject in question will be found on page 245 of Volume 7. But further information elsewhere may also be indicated in the usual way. The latest census figures for populations of cities, towns, etc., are given, and in some cases these may be found to differ from earlier figures given in the first seven volumes.

Key to Pronunciation

Most of the subject-headings in The Book of Knowledge require no special indication in the way in which they should be pronounced. There are also many for whose proper pronunciation it is only necessary to know which syllable is stressed; in these cases the stress is shown after the syllable, thus, A'jax. The pronunciations given are those preferred by the most recent authorities. For foreign names the native pronunciation is given except where the English pronunciation is well established. Where further guidance is necessary, the following signs are employed:

an as mixiner	vowers in italies have a sturred or obscure sound as
aw a as in ball	m abet (abet), recent (ré'sent), conform
vowel sound in fern, word, girl, curl	(konform'), nation (na shan), tailor (tá'lor)
ow yowel sound in now, bout	th first sound in thing, thank
oi - vowel sound in noise, boy Unmarked vowels have their short sound, as a m	the first sound in the, that
hat, e in bet, i in bit, o in not, a in but, oo	zh s in measure, leisure
in book	g hard g. as in good, girl
Marked vowels have their long sound, as in hate,	soft g, as in gem, ginger
bē, bīte, note, tūne, boon	kb guttural in loch

Abbreviations Used in the Fact-Index

Abbreviations most commonly used in this work are listed below; those abbreviations also often met with in conversation or reading are given separately; in the Fact-Index lists of counties under England, N. IRELAND, SCOTLAND and WALLS, and states under UNITED STATES OF AMERICA give abbreviations where appropriate

a., area agric., agriculture Amer., American, America anc., ancient b., born biol., biology, -ist bor., borough bot., botany, -ist Brit., Britain, British c., circa Can., Canada, Canadian cap., capital cath., cathedral Cath., Catholic cent., central, century ch., church Chom., chemical, chemistry co., county d., died dept., department diag., diagram dist., district Eg., Egypt, Egyptian emp., empire, emperor Eng., England, English esp., especially est., estimated establ., established f., facing (of plates)

MANY of our letters derive from picture-writings of animals, birds, and parts of the body. The birds, indeed, gave us a large number of letters. The owl, for example, with its horns and its beak, gave us our M. The letter Z was originally a duck of ancient Egypt, while the eagle grew into our A. In Egyptian picture writing the eagle first had its proper shape like this:

Then as it came to be made by the Egyptian

scribe in to this. When the letter in this second torm passed over into the Phoenician alphabet and was used in stone inscriptions, it was found easier to carve by using straight strokes of the chisel, and it was made like this: * It was left to the Greeks to adopt this form for their letter alpha, A gradually straightening it until in its classic form A it was little different from our own letter.

Shipping term, 1-1; at Lloyd's,

Al. Shipping term, 1-1; at havya's, 4-533.

Aachen [ah'khen]. Tn. in Ger., 45 m. by rly, w. of Cologne; pop., 110,000, 1 1; woodlen industry, 4-5.

Aalborg (awl'horz) ("Eel-town"), Jenmark, port of Jutland; pop. 60,880; exports fish, grain; miportant commercially from medieval thuss. 3-72.

Aar [ahr]. Largest r. (180 m.) entirely within Switzerland; rises in Aar Glacker and flows x.w., falling into Rhine opposite Waldshut,

Aardwark. An untecting mammal, 1 2.

Aardwolf [ard'wolf] ("curth wolf"), a hyena-like mammal of Airiea; food chefly termites and carrion.

Aarhus [awr'hoos]. Second largest city

food chiefly termites and carrion.

Aarhus (awr'hoos). Second barges (city of Denmark; pop. 07,3.0., trade in groin, cattle; shipyards, irontomdries; sent of hishop since 10th cent.; fine 13th cent, cuth.; 3-72.

F.C.G.I.—Fellow of the Chartered Insurance Institute.

F.C.I.I.—Fellow of the Chartered Insurance Institute.

F.C.I.S.—Fellow of the Chartered Institute of Secretaries.

F.C.S.—Fellow of the Chemical Society.
F.D.—L. Fidei Defensor, defender of the faith.
fec.—L. fecit., he (she) did, made (it).
ff.—Ital fortissimo, very loud (music).
F.F.A.—Fellow of the Faculty of Actuaries.
F.I.A.—Fellow of the Institute

F.I.A.—Fellow of the Institute of Actuaries.

F.I.A.A.—Fellow (Architect Member) of the Incorporated Association of Architects and Surveyors.

Abuna. Coptic dignitary, chief priest in Abyssinia, 1-6.

Abu Simbel. Locality in Egypt famous for its rock temples of Rameses II : colossi of Rameses, 3-191 illus.

colossi of Ramescs, 3-191 illus.

Abydos [abl'dos], Asia Minor. Ancity at narrowest point of Heliospont, where Kerkes built bridge of boats; home of Leander.

Abydos, Egypt. Anc. elby on Nile, once second only to Thebes; held sacred as burial-place of Osiris.

Abyssinia. Kingdom of N.E. Africa, also called Efficipla; area 350,000 eq. m.; pop. 11,000,000 (with Eritrea, 12,000,000); cap Addis Ababa, 1-5; conquest by Italy 1935-36), 4-317, 7-485-481 illus. ilberation, 1941, 7-490; origin of name Ethiopia, 3-302; discovery of coffee, 2-441; Eritrean federation 3 295; flag, 3-385 illus, f.

Acada (akā'sha). Plant of the family I ryuminosae: some 500 species 1-8. Acad mie Française. See French

Academy.

Academy.

Academus. (ik. hero in whose honour a house was built at Athens in which Plato founded his school, 1-9.

Academy. An association or place for higher learning, 1-9.

Acadia, or Acadie. Name given by the French to former Fr. colony in N. Amer.; ceded to Brit. in 1713, and renamed Nova Scotia, 5-170.

Acajula. Spt. in El Salvador; pop. 2,500; exports coffee, 6-193.

Acanthomyops nigra. Common black

2,500; exports coffee, 6-493.

Acanthomyops nigra. Common black ant, 1-163.

Acanthus [akan'thus], a plant, found chiefly in the tropics and s. Europe; leaves inspired Corinthian capital in architecture.

A capella. See Musical Terms (table).

Acapulco. Spt. on w. coast of Mexico, 230 m. s.w. of Moxico City; pop. 9,993; exports copper, fruit und hides, 5-186.

Acari [ak'ari]. An order of arachalds including mites.

Acarl [ak'arl]. An order of arachilds including mites.

Accelerando. See Musical Terms (table).

Acceleration. Bate of change in speed or velocity of a moving body over a period of time. It is expressed in feet or centimetres per sec. ter sec. 4 86; of sub-atomic particles, 3 17.

Accent. See Musical Terms (table).

Accentor. The so-called hedge sparrow 7 123

Accentor. Ti

ACCRUED INTEREST

Accents. Pronunciation marks; in (ik., 4–92.

Accidents. See Musical Terms (table).
Accidents. Read accidents, 6–409; caused by dust explosions, 3–330; prevention by automatic devices, 1–327; in lifts, 4–496.
Accipitridae (2001.). Family of birds including eagles, hawks, buzzards and kites, 4–115.

Accolade, in ceremony of knighthood, 4–417.

Accountant. Person who has charge of the accounts of a business or other concern; as a career, 2 232.

2-11.
Accounting machine, 2-168 filus.
Accounts, book-keeping, 2-10.
Accora (akrah'). Cap. of Brit. Gold Coast Colony, W. Africa; rly, and air terminus; site of Achimota College; pop. 135,926; 4 11. 7 140.

Air Force.

Aeroplane, pilotless, as guided missile 4-103.

Aerosol. Form of colloid, 2-455.
Aeschines [6*kinez] (389-314 B.c.).

Athenian orator and statesman.

Aeschylus [6*kines] (525-456 B.c.).

Gk trugic dramatist, 1-45, 3-116;

Prometheus Bound, 6-294.

Aesculapius [6*küh*pius]. Greek

physician, 1-45.

physician, 1–45.
Aesculus hippocastanum. See Horse

Chestnut.

Aesop (c. 620–560 B.C.).
teller of tubles, 1–45.

Aesthetics Branch of philosophy.

Asstration. Summer sleep of certain creatures, similar to hibernation (winter sleep); of crecodiles, 4-173

Astas. Pygmy people of the Philippine Isles, 6-312.

Astive [50/shugs] (4-454) Rom

1414, 6-312. Rom general, saviour of Europe by his victory (151) over Attila at Châlons; murdered by Valentinan III; and Attila, 1-308.

Attini, 1-300.
Acthelistan. See Athelstan.
Actolia [cto'lia]. District of Greece
N. of Guif of Corinth; Actolian
League became chief rival of Achaean
League in the 4th and 3rd cents. B.C.
Affermatic pressure in human beds.

Afferent nerves, in human body: work of, 5-368.
Afferestation. The planting of trees

work of, 5-368.

Allorestation. The planting of trees on land which is naturally bare or has not carried trees for some period. In Gt. Brit. is controlled by the Forestry Commission.

Affray (British submarine). Sank in English Channel in 1951; the wreck, in 258 ft. of water, identified by means of an underwater television camora; 7-254 illus.

Afghan cound. See Dogs (table).

Afghanistan. Mountainque inland country of Asia; area 250,000 sq. m.; pop. 11,500,000; bap. Kabul, 1-48, with map; ilag, 3-385 illus. f., stamp, 7-143 illus.

TERMS COMMONLY USED IN AERONAUTICS

Asrobatios Manocuvres performed voluntarily other than those used in normal flight (e.g. inoping the hop).

Asrodynamios Branch of physica dealing with forces that act on landles moving through the air See Streamining Aerofoil

ining
Aerofoil Any aircraft structure such
as a wing or rudder which sets against
the air to provide lift or to help control
Aileroa A linged Il 47 on the trilling
edee of a wing it can be titled by the
pliot to force the wing up or down
Airframe. An aircraft without its

Air Pocket. Vacuum in the air on an aircraft's direction of flight. It results in reduced lift under the aircraft wings Airsorem. A propeller. Air speed. Speed of an derraft relate to the air through which it is flying as distinguished from its speed relative to the ground.

as distinguished from its speed relative to the ground Altimeter Instrument registering approximate intight above sea level Altitude Height above sea level Amphiblan Aircraft that can take off from or alight on land or water It has retractable wheels in the built Aspect Batto Ratio between the wing spin for affect of the bond wing spin for affect of thorn wing tip to wing tip and the chord of our wing Athedwal Albivy-lation of teratities.

wing spin it in alter of from whing the variety and the chord of our wing the shortest at the chord of the country modynamic duct a form of jet engine that do snot have a turbine compressor or other moving parts commonly elled a rangle (which see).

Attack Angle The upgle between the line along which an in a points and the line of its motion, that is the ingle between a wing chord and the country thrist of the singularity of the country of the singularity of the si

Aircraft with two wings, Blolane

ne shove the other
Blackout Lows of consciousness while
miking a first turn or when pulling out
of a disc. Caused by centrifugal force
draining bood from the brain
Black divisor.

Blind flying Navigating in archaft by instrument Indication when visibility

prevents outside observation

Camber The curved surface of a wing between the leading and trailing

Ceiling Maximum altitude an air craft can reach Service ceiling is the altitude to which an alteraft can ellinb at a specified rate of feet per second Chord The distance between the

at a specified rate of feet per second Chord The distance between the leading and trailing edges of a wing Cockpit. That part of an aircraft from which it is controlled in light Contact. Warning from pilot to meclanic that engine ignition is turned on preparatory to take off.

Crabbing Sideways drift of an aircraft nilight or when landing cross-wind landing Landing not in line with direction of wind over runway. Crusing speed. The speed at which an aircraft files most economically. De-lose Chemical or incchanical device that prevents formation of ice on wings, propeller, or control surfaces. Delia wing Aircraft wing in the form of a triangle so called from the Greak letter A (delta).

Dithedral The angle between the foorbountal surface of a wing and the fuselage.

tuscinge
Drag Resistance an aircraft has to overcome in forward motion through

Rievator Hinged horizontal structure an on aircraft's tail assembly, und to govern upward and downward direction of flight

Endurance The time an aircraft can maintain flight without refuelling

Fairing Streamhned owl placed over any irregularly shaped projecting sinface likely to offer increased resistance to forward movement.

Feathered propeller layer of propeller having blades that can be furned edge forward, so that they will not revolve when the arrest moves through the air with engine stopped.

Fin layer surfaces on the trilling edge of a wing lowered to increase an resistance and let is a landing to the Float Under carringe of a scaplane.

Float Under carringe of a scaplane.

Flying Boat Alternit with a battlike half for alighting on water.

Fuseinge the body of an accipione which wings and ful resemble an

" The load or pull unposed up on ing? The load or pull imposed upon a pilot or his aircraft by centrifugal force during a turn. The stright if it is measured by comparing it with the force of gravity which is defined as one ig.

Gliding Angle Slanting dir ction of Gliding ratio bicking with the soil Gliding ratio bicking allocate on reach in relation alt ling alter aft to its althride

Gravity, Centre of That point of mair craft inselve where the arcraft would believe without tipping brekward or forwards if mounted recess v. 1 m., Helicopter Alter of with overly all power driven horizontal rotors. If can

rise or lescend vettledly feing les deposit d on an aircraft surface, partledful slugs Impeller—The rot ting part of a turbo

jet engine Incidence Angle Angle between the chord of a wing and the in rize at al centre

of the mission in the first many interference. The first many by the proximity after the causes the course the causes the

dread wing their my by the proximity of mather surface. Hal causes the caddies and induces that causes and induces that surging from the resonance of the proximity of the proximity mather than 10 the proximity of the proximity the final of attack (s. Attack Angle)
Longoron Main spar or god a fround

which in merit fusclige is built

Loop, looping the A complete vertical tinn made in the dr Mach No Letto of an alterrit's speed to the speed of sound under the same atmospheric conditions

atmo pincia coinditions
Monoplane Aucraft with a single
plane of wing
Nacelle Housing for engine of crew
built out on a wing
Payload I hat part of the total weight
of in alcraft accounted for by crew,
passingers and fright
Puch The augh of an alrected blide
in riction to the alrilow in which it is
tunning a variable-pitch airsorem on
be adjusted to give "after propiler
bite with the author
Putot Tube Tube with an open end
orward mounted on nose or leading
edge of wing It gathers air during the
forward movement of the aircalt and is
councided to a meter which registers

forward movement of the intralt and is councited to a meter which tegislars fiving speed.

Powor Dive Downward flight of an airr of with engines at full power.

Propulsive Efficiency The maximum propulsive power developed by an air-craft right in light.

Pressurised Aircraft cabin that min tains its interior in pressure at approximately the atmospheric pressure of air at ground level.

at ground level
Pulse Jet Type of reaction (jet)

Rib Internal support of a wing running from trailing t leading edges Roll leating trailing t leading edges Roll leating at a plane around its axis so that it turrs over on its back and o mass applight again.

Seaplane Aircash fitted with flowers that it can take off from or allight on

Sidealin Sideways and downwards

Sidealip Sideways and downwards in overnent of an already when it is beld on a strught courte with wings tipped Slipstream Body of an thrown lack by in the ready Slots. Dyner on the leading dge of a wing to delay stalling of an anneal at Sound Barrier Point when already speed quals that the speed of scanneal at the ancertiffs distribute Span Length of an already wing to make to the.

Span Length of an alreadt wing it in tip to tip

Spar Chief structural support of an alreaft's wing from root to tip

Span Rapid lendwhight full of an iter if nose first down a steep cork saw path. It is cheed by I so illiteralting from a cell see Stalling

Spanner streamlined turing (so Farring) litted to the front of and revolving with a propolite a limb

Stabiliser Tixed horizontal or vertical the or the tall of an aircraft to hold it in moral diving position.

treat the on the fall of an arrest to hold it in normal fiving position.

Stability Priperty of an alteraft to mint an straight in I level flight.

Stalling All wing in arrest in a fact to be jow reather his made in too is lost.

Statosphere Resident flowed in those lost. Streamlining A redynamically ship by in interacts wings and fineling to it he indication in state to the it. Supersonic Speed. After if which is a ling that of sound.

Supersonic Speed Affectit speed of this chief that obtained Swept White Mirrialt on which the sample of the wing tapers, or is swept back to the rear.

Struct Any stin tural part of an district that holds ofte parts in the Caupething an interiff capine with air at more than atmosphirle pissine.

Taxising Moving an aircraft along the ground under its own power.

Three-point landing I inding an interiff so that all handing whichs make houldandous could be with the ground.

Thrust The power developed by the ration of a jet engine. Measured in this shoise power.

Torque Twisting lotte that tends to make a acryline roll. Caused by the gyroscopic effect of rotiting engine parts.

Transonic Speed Aircraft speed in access if the speed of round Turbo-jet form of act engine which uses a turbine-shiven compressor to in

Alton. Market tn. in Hants, Eng.; pop. 8.636. Altona, Germany, scaport now form-ing part of city of Hamburg; pop. 241,000.

Alto relievo. Sculpture or carving in which design stands out prominently from the surface to which they are attached.

attached.
Alto-stratus, clouds, 2-423.
Altinoham joi'tringam]. Bor. of Cheshire; iron working and other industries; pop. 39,787.
Altruists (from Latin aller, "other"). School of philosophers, 6-159.
Al'um, potessium aluminum sulphate, used as astringent in medicine, as mordant in dyeing, in tanning, fire-proofing; coalmordant in dyeing, in tanning, fire-proofing and shower-proofing; coal-gas by-product; in sulphuric acid mfr., 1-12; old alum works, 2-324 illus; a double sulphate, 7-137. Alumina, Mineral; trioxide of aluminium, occurring as corundum and in foldspars, etc.; alumina cement, 2-290.

Aluminium. The most abundant metallic element in Nature, forming 8 per cent. of the earth's crust, 1–127; alloys, 1–114, 116, 5–177; in Periodic Table, 3–224; aluminium paint. 6–38; aluminium bronze, 2–92; as backing for mirrors, 5–225; ore, 5–216; and chromium, 2–383; and ultrasonics, 7–344; ultrasonic welding 7–436.
Alum root. Perennial plant, family Saxifragaceae, native to N. Amor. Root is very astringent, hence the name.

Artificial abrasive made Alun'dum.

Alua dum. Artiucial aurasive made from aluminium oxide. Aluta, Alt, or Oliu. R of Rumania, rising on n.w. slopes of Carpathians, it flows 315 m. to the Danube,

6-470.
Alva, Fernando Alvarez de Toledo, Duke of (1508-83). Span. governor of the Netherlands, 1567-73, under Philip II. Imposed ruinous taxes and crushed religious liberties. Revolt broke out in 1508 and again in 1572, 7-154.
Alvarado, Pedro de (1486-1541). Sp. conqueror of El Salvador; second-in-command to Cortés in conquest of Mexico. Became governor of Mexico.

in-command to Cortés in conquest of Mexico. Became governor of Mexico, and later of Guatemula. 6-493.

Alveoli. Tiny air sacs in the lungs, and respiration, 5-31, 52 diag.

Alwar. City in Union of Rajasthan, India; pop. 57.868.

Amadeus I [amadā oos] (1845-90), King of Spain, son of Victor Emmanuel II of Italy; accepted crown from revolutionists (1870); abdicated in 1873.

Amadia of Gaul. Title of famous

Am'adis of Gaul. Title of famous medieval prose romance originally written in Portuguese, in imitation of the Arthurian legends.

of the Arthurian legends.

Amalekites. An anc. tribe of Edomites, foes of the Israelites; crushed by Saul and David.

Amal'fl. Scaport of Italy; pop. 7,100; lifth-cent. cathedral and old Capuchin monastery; in Middle Ages was a republic and rivalled Genoa and Pisa. Soap, paper, macaroni made.

Amalgam. A mixture of mercury with another metal, composition.

1-116

Amalgamated Press, The, and Lord Camrove, 2–194.

Amanah (river), See Abana.

Amanita muscaria (fungus), See Red-cap Amanita.

Amanul'lah (b. 1892), Amir or King

of Afghanistan (1926-29), 1-47.

Ama'ra, Iraq. Tn. on the Tigris, about 150 m. N. of Persian Guif; taken by British (1915).

Amaranth

m'aranth. Flowering plant of the genus .ima anthus, such as love-licableeding and Joseph's coat.
Amarna, Tel-el. See Tel-el-Amarna.
Amarplid'aceae. Botonical family of plants including daffodil and narollems.

mazon. R. of S. Amer., length 3,350 m. to 4,000 m., 1-129; forest. 2-15; navigation on, 2-49; rainfall, 1-148; monkeys, 5-240; valley. 7-96. Amazon.

Amazons. Legendary female warriors. 1-180.

1-130.

Amazonstone, variety of feisispar; agemetone, 3-345.

Am'ba Alagi [alah'gē]. Abyssinian mountain fortress, 9,000 ft. alt., neath Magdala; Duke of Aosta's surrenderhere in May 1941 to Imperial force was virtual end of It. resistance in Abyssinia.

Ambala. Tn. of Punjab, India; pop 76,336, 6-310.

AMBASSADOR

Ambassador. A minister representing one sovereign state in the capital of another, 1-131; 6-62.

Ambar. Fowaii resin derived from extinct coniferous trees, 1-131.

Ambargris. Grey fatty substance formed in intestines of spermareti whale, 1-131; as fixative in portune, 6-124.

Ambasside. Th. in Lake dist., Westmorland, Eng., pop. 2.343; 4-438.

Amboins. Th. France, on r. Loire, 15 m. E. of Tours, 5-18 illus.

Amboyna or Amboyna. Chief city and comm. centre of Molucca Isls., Indonesia, on Amboyna Isl, in N. of Banda Sea; pop. (isl.) c. 278,000.

Ambrose, St. (c. 340-397). Patron saint of Milan (where Ambrosian ilbrary is named after him); reproved Theodosius for Thesalonian massacres; introduced Ambrosian chant. hant

definition of the gods, giving immortality; name later applied only to food, and drink of the gods was called nectar.

Ambush, H.M.S., British submarine, 7-175 illus.

(1826).

(1826).

Amiens. City of Fr.; cap. of Somme dept.; pop. 84,787, 1 139; treaty (1802), 1-139, 5-319, 7 317; and World Wars, 7 482, 7-487,

Amines. In chemistry; as organic bases, 1 12.

Amino soids, and proteins, 5-444, 6-297.

Amieth. See Hamiet.
Amman. Cap. of Jordan; p. 170,000; the Rabbeth-Ammon the Bible; camel-market, 4-3

383, filus. Amman, Jost. Swiss engraver (1539– 91); woodcuts, 2-3, illus. Ammerses. Lake 10 m. long in s.

Bavaria.

Bavaria.
Ammeter. Instrument for measuring electric current in ampers. Simplest type consists of an electromagnet which is energised by the current being measured. This in turn attracts the base of a pivoted needle moving across a dial marked in ampers and fractions of amperes. The movement of the pointer and therefore the amount of amperage measured is governed by the strength of the magnet, which in turn depends on the strength of the current; in motor vehicle, 5–282.

Ammon, or Ammon-Ra. Chief god in Eg. myth., originally local god of Thebes; represented with ram's horns; temple, 3–187 illus; Siwa temple and ammonia, 1–140.

Ammonia. Colourless gas, with a pungent odour and alkaline properties, extremely soluble in water, Instrument for measuring Ammeter.

1-140; composition. 1-112. 5-443; shape of molecule. 2-319; ding.; in gas mfr.. 3-307; m refrigeration. 6-378; in industrial chemistry. 2-325, 528.

Ammonia sulphate. Ammonia and sulpharic acid; used as fertiliser. 1 140.

1 10.
Ammonite. Fossil snail-like molluse, now extinct; ancestor of the pearly nautilus found in Pacific and Indian oceans, 5-232, 3 125, illus.
Ammonites. Senutic trube hybrid w, of the Jordan, finally subdued by Judas Maccabacus; and Israelites 4-27!

Ammonium carbonate, or Sal volatile, 1-112, 1-140.

Ammonium chloride. Sal ammoniae

Ammonium hydroxide. Ammonia gas, with water, "ammonia," 1 140.

with water, "anmonia," 1 140.

Ammonium nitrate, Ammonia and nitric acid; 1-140; nitrogen from, 5 143.

5 143.

Ammunition. Artillery supplies, 1-260

Amnesia. Loss of memory, 5-167.

Amoeba. The simplest form of animal life, consisting of one cell, and multiplying by division, 1-140; behaviour, 1-152; as simplest form of protozon, 6-298; respiration 6-389; 1-157, illus.

Amoebic dysentery, 1-141.

Amorites. Semitic people who con-

Amoshie dysentery, 1 141.

Amorites. Semitic people who conquered the Sumerians and Akkadians in Mesopotamia; Hammarubi (2123-2081 B.C.) and first Babylonian empire, 5-176.

Amos. Hebrew prophet (8th cent, B.C.), earliest of the "writing prophets," 6-296.

Amoy. ('ity and spt. of S. China; pop 234,000; exports ten, porcelain, paper. Name from Chinese Hammen, Ampers, Andre Marie (1775-1836). Fr., physicist; a pioneer of electrodynamics; his memory, 5-168.

Ampers. In electrical engineering, the practical unit of current energy, A current at a piessive of one voit passing through a conductor baying a resistance of one ohm registers one ampere (amp.). Named after André Marie Ampres, 3-221.

Ampers-Hour. Unit of quantity of observators.

clectrolitic means, 3-221.

Ampere-Hour. Unit of quantity of electricity. It is the quantity represented by a flow of one ampere for a period of one hour; or an equivalent quantity, e.g. two amperes for 1 hour. One ampere-hour is equal to 3,600 coulombs.

Amphibia. Class of vertebrate animals including frogs, toads, newts, etc.

Amphibious craft. The "Alligator,"

hibious 252, ilius. 252, ilius. Aboles. A group of nunerals, meeu found

1-252, illus.

Amphiboles. A group of minerals, in shides of brown or green found in certain igneous and in tamorphic rocks. Best known are hornblende and a type of asbestos, 5-211.

Amphibrach. In poetry, 6-233.

Amphimacer. In poetry, 6-233.

Amphineura. Class of molluses, 5-233.

Amphiox'us, also called Lancelet.

Genus of aquatic sand-burrowing animals resembling primitive verteburates.

animals re-embling primitive vertebrates

Amphisbaena. Type of lizard, 4 529.

Amphisbaena. Type of lizard, 4 529.

Amphisbaena. In classical times, roofless, almost circular, building with tiered seats for watching public shows; Colosseum at Roine, 2-461; arena at Nines, 6 438, illus, theatre at Epidaurus, 4-03, illus, Amphitrite (amfirit'il). In Gk. inyth, sea-queen, daughter of Nercus and wife of Poschion.

Ampheroria Amoral. Anc. Gk. vessel for holding liquids, 1-11, illus.

Amplification, in cleerricity, 3 222.

Amplifier, and radio, 6-316, 340 illus. f.

Amritsar, India. Cap. of dist. of same name in E. Punjab; pop. 400,000; centre of Sikh faith; siks, shawls, carpets; seene of riot in 1919.

Amstel, riv. of Notherlands; Amsterdam on, 1-141.

Amsterdam. Commercial cap., largest city, and spt. of the Netherlands;

pop. 845,266; 1-141, 5-370; Bank and Dutch commerce, 1-361, 363.

Amsterdam-Shine Canal, Netherlands. Connects Tiel with Amsterdam opened 1952; 45 miles long.

Amu-Daria (anc. Oxus). Great riv. of cent. Asia, rising on Pamir Plateau and flowing about 1,500 m n.w. to Aral Sea, 1-266.

Amundeen, Roald (1872-1928). Norwegian navigator and explorer; first man to reach S. Pole; 6-244; polar flight, 6-243 illus.; and N.W pass age, 2-200.

Amur. Great navigable r. of E. Asia (2,920 m.); gives name to prov. in Siberia N. of river; 1-268, 5-112. 7-48.

Amylop'sin, Starch-digesting ferment secreted by pancreas.

Anabap'tists. A 18th-cent, religious

Meet,

"Anab'asis." Xenophon's account of
the expedition sent by Cyrus the
Younger against Artaxerses.
Anab'olism. The chemical process by
which living matter builds up com-

Anabolism. The chemical process by which living matter builds up complex proteins.

Anasonda. Giant non-poisonous snake of python family; native of Brazil and Gulana, up to 30 ft, long; 2-45 illus.; 7-75 illus.

Anao'reon (563-478 B.C.). Gk. lyric poet; famous for songs of love.

Anao'reon (563-478 B.C.). Gk. lyric poet; famous for songs of love.

Anao'reon (563-478 B.C.). Gk. lyric poet; famous for songs of love.

Anao'reon (563-478 B.C.). Gk. lyric poet; famous for songs of love.

Anao'reon (563-478 B.C.). Gk. lyric poet; famous for an long.

Anaemia. A discuse of the blood. 1-491; from malaria, 5-93; liver extract in treatment of, 4-524.

Anaemia. A discuse of the blood with the body from the polsoning and origin of air, 1-82.

Anaesthesia, in medicine, 1-142, 5-165 use of ether, 3-302.

Anaesthetist, work of, 1-143.

Anaesthesia, work of, 1-143.

of the body free from pain, 5 165.
Anasstatetst, work of, 1-145.
Analysis, chemical, 2 324.
Analysis sites, in geometry, 3-520.
Analytical geometry Method introduced by Descartes for applying processes of algebra and analysis to geometrical problems; 3 518 with diag.

ding.

Analytical psychology, Jung's theory

Architecture.
Architectural Terms.
Archonas. Nine elected officials of ancathens sharing supervision of religion, war-burials, aliens and law.
Arco. Anc. city of N. Italy, 4 309 films.
Arcot, battle of (1751). Italia: ('live's victory over Fr., 2 411, 4-252.
Arctic Ocean, Islands, 1 220; area, 5-194.

Arctic Ocean, Islands, 5-194.

Arctic Regions, 1 220; polar exploration, 6 212; Midnight sun, 5 200, with illius, f.; weather compared with Antaictic, 1 164.

Arcturus, Chief star in the constellation Bootes, and brightest star in the northern sky, 7 145.

Ardea (species). See Heron.

Arden, Forest of, Wooded dist, of Waiwlekshire, Eng., once a much larger forest. Shakespeare knew the forest well, and woodland stems, set in Arden, appear in As Fou Like II.

in Arden, appear in 48 1 on Loke II.

Ardennes. Wooded plateau and hills
in S.F. Belgum, Luxemburg and
northern France

"Ardil." Fibre resembling wool,

made from protein of ground-nuts, 6-369.

Ardnamurchan Point. Westerning point of the mainland of Gt. Bri in Argyllshire, Scot. It has Westernmost hghthouse.

hghthouse.
Ardrossan. Scot. spt., Ayrshire; fish ing, engineering works, pop. 8,799.
Areaa aut. Sie Betel.
Areaa of Nimes, Fr. One of the finest Rom. ruins in existence; 437 ft. long by 332 ft. wide.
Areaig Fawr. Mi in Merionethshire, Wales, 2,800 ft., 5 175.
Areopagitica. Pamphlet by Milton in defence of the freedom of the Press, 5 210, 3-286.

5 210, 3-286.

5 210, 3-286.
Areopagua. Sacred hill of Athens, named after Ares, god of war, 5-136.
Areoquipa. City of Peru, cap. of Arequipa dept., pop. 97,110; industries, 6-141.
Ares. in Gk. myth., god of war, identified with Rom. god Mars, 5-136.

Ares. In Gr. myth., god of war, dentified with Rom. god Mars, 5-136.

Areszo (aret sö). It. erty; pop. 60,200; 13th cent. cath; art treasures; buthplace of Guido, Petratch; anc. Aretfum, one of 12 great cities of Etrurin. Heavily damaged during 2nd World War.

A.gall. Wild sheep native to Altal mts. and Sherhan steppes. About the size of a small donkey, 7-20.

Argand, Aim's (1755-1803). Swiss chemist and mathematician; invented Argand smokeless gas burner; improved oil lamp, 4-143.

Argentina. Republic of S. Amer.; pop. 16,105,244; cap. Buenos Aires, 1-223; claim to Falkland Isl. Dependencies, 1-170, 3-338; flag, 3-355 illus. f.

Argentoratum. Rom. tn., modern

Argentoratum. Rom. tn., modern

Argonorms
Strasbourg.
Argives. Inhabitants of Argos in anc.
Grooce. Homer used the term for
Greeks in general.
Argo. The ship of the Argonauts, Argo. T 1-226.

Argol. A tartrate in wine less, 7 228. Argolis. Anc. Gk. dist. in N.E. Peloponnesus.

Argon (A). A colourless element of the Argon (A). A colour-ses ciencia of the inert gas group; atomic weight, 39-94; atomic no. 18; 3-224; discovery by Rayleigh and Ramsey, 6-363; in air, 1-79, 81.

Argonaut or Paper Nautilus. A soa moliuse, 1-227.

TERMS USED IN ARCHITECTURE AND BUILDING

Alseve. A recess of considerable size in a room.

Apse. A semicircular apace opposite

in a room

Apse. A semicircular space opposite
the entrance of a basilica
Arabasque A form of ornamentation
highly developed during the Roman and
Renaissance periods, of a fanciful charte
ter The name means Arabian but frue
Arabian ornamentation is called
Moreguna Arabian Moresque Arcade.

Moreque

Areade. A scrice of open arches supporting a roof or an upper stere. Ilso a long gallety that is arched and has shope on either side, sometimes a nurow street that is covered over

Architerve. The lowest part of mentablature, rating on the capital of the column. Also the monding round a decretor whellow.

door of window

Band of moddings, etc., Archivolt

carried around a curved opining
Arria Corner when two planes meet
Ashlar Squaied or dres ed 'blocks of stone

Basilica Originally a hail of justice among the Greeks and Romans. In the early days of Christianity Clurches were given the same general plan which was that of an oblong building with a nave,

aides, apso, and sometimes a frans pt Batten. A narrow strip of wood Batter. Slope of a wall face as it diminishes in thickness with increase in

holght Bay An offset in a wall, as one of the compartments between pilasters of pilasters of a room forming recess a window opening with framing

A horizontal supporting member of timber steel or concrete, resting

ber of timber seen various two or more supports

Bavel. Whished surface at an urle short angle. When a sharp other than a right angle. When a sharp corner is cut off, it leaves a flat surface called the beach. When a countr is bevelled off equally he removing the arris, it is oduces a chamier.

Bond. In a wall of stone, brick or is the contract of the contract

similar units, the arrangement of the units to 'brak joint' and dood strength, also the pettern produced on the face of the wall by this urangement

Bracket A projecting member sup-porting an overhanging weight often an ornamental member to carry a statue or similar object

similar object.

Bridging (1088 pieces between joists or stude to act as stiffen to Butt joint. The joint formed by placing two members end to end

Buttress. A brickwork or masonry mass which projects beyond a wall to take its thinst. When detached from the wall at the foot an i arched over, it is termed a flying buttress

Caleson. A watertigit enclosure or casing sunk into the ground to allow

work on the foundations of a building
Capital. The ornanental head to a
column. It identifies the order to which the column belongs

Casement. A window which opens on hinges or pivots

ninges or pivots
Clerstory. A part of a building that
rises above and clear of other parts of the
roof, it contains windows for lighting
the interior Originally that part of a
ohurch above the roofing of the isles I y
means of which the upper part of the
nave was lighted
Conduit. A channel or pivot to the

Conduit. A channel or pipe to carry water. The pipe or casing through which electric wires are run.

Coping. The cap run continuously around the top of a wall

Carbel. A support projecting from a wall; courses set beyond the lower ones in brickwork or masonry form corbel CONTRES.

Cove. A surface that is continuously A quarter-circular moulding.

Damp-sourse. Horizontal or vertical layer of some moisture-interrupting material built into walls

Dermer A vertical-framed window in a sloping roof, a structure projecting from a roof having a window in it.

Dowel. A pin of wood or metal let into two parts or members to hold them together.

Drip The grooved underside of a sill or moulding or other part that projects. The groove causes rain to drip instead of running back to the wall. Also the strp in a lead gutter or lead flat when sheets overlip. overlap

overup
Elevation Side or end view of an
object, or a representation on a perpen
dicular plant
Fagade The front of a building

Façade The front especially its principal

capetalls to from on a binding capetalls to principal foot a far shaped window in the fact of a door or window Now applied to rectangular lights in that osition—often bluged or pivoted to open n ventilation

Final the decorative piece frequently in the form of a knot or brack of foliage, which finishes off a pinnacle or gable

Firing Strips of wood on the inside of a brick stone or concrete wall to give a level surface for bourding ete Flashing Metal placed at joints be-tween wills and root to prevent water

entering

Flat Suite of rooms on a single floor

Flat Suff of rooms on a single near
in a building of two or more story as
Flue A passage to carry off air,
smoke or gas
Fluting Channels which are cut on
the shafts of columns—I ach channel is

Footings Connect of blickwork or masonry resting on the foundations made wider than the walls in order to give greater beauting.

Foundations Lowest part of a stance roundations fower pire of a strict true that transmits the wight of a build ing to the ground on which it is built t suilty of concrete made wide so as to spread the load over a greater men

(5) Grillage)
Frame A structural member built up of the and struts in a series of tri

(See Truss) less the tunber or steelwork Framing the tunber or steelwork skeleton of a building Fresco A decoration in water colour

Friere An entablatine has three divisors and the face is the middle one It is sometimes on amented lopart of a wall above the picture fall.

Girder Any main homeontal member

which supports the floor beams or a partition. Similar principal member of

A mattices of steel learns Grillage bolted together usually in two layers with the beams of each at right angles to the other, used as a foundation in bid ground

Grille A series of wood or metal especially of wrought hou in an ornamental design used marches forces etc. Half-timber Work. Method of construction in which the walls are of thinber frames having the openings filled in with high two-

Head The upper horizontal member of a door or window opening

Header the end or short face of a brick as it shows in the face of a wall Jamb Vertical sides of a door or window opening etc

A horizontal timber of steel Joist be un to carry a floor, celling, or roof Lintel. Horizontal member of timber, stone etc. spanning an opening.
Metope In the Doric frieze the spaces

between the triglyphs are called metopes In the Parthenon they were sculptured Mitre. A joint in which the members

cut at an angle and butted together Mortus. An opening or pocket cut in a member to take the tenon of a mortiseand-tenon joint

Mullion. The upright posts or divi-sions in window openings

Munin. Vertical members between panels of a door. The outside vertical members are "stiles"; the horizontal ones, "rails"

ones, "rails"

Nave The central part of a church or cathedral from the entrance to the altar. The nave is usually lighted from above by the windows in the elerestory.

Newel-post central post in a winding state case, supporting inner ends of the steps, post carrying the handrill.

Nosing A rounded edge which projects as on a stall tread.

Oriel A projecting window of polygonal or semi-cylindrical form and divided by multions and transoms into different bays and other proportions.

different bays and other proportions Pier A post or pillar used to sust in a beam may be detached (or separate) or may be uttached (built into a wall)

(See Pilaster)

Pilaster & pier of rectangular hipusually set in the wall of a building with
a projection of about one third its width requently treated to give the appear of a column

Plate A horizontal timber used is a bearing, a a wall plate
Rail A member placed horizontally as in a door, a fence, pundling etc.
Rebate. A lecess off or formed in the odge of a number to take in France to

edge of a member to take a frame etc.

Return A structural member that
turns and ends against a surface.

Reveal The wices of a door or win
dow opening it right angles to the face

dow opining it right angles to the extend along the top of a roof and to which extend along the top ones of the rifters in fistened.

Riser The upright piec in a stu-

in estur

Rose window Any circular wind w that is decorated a with tracery. Als cilled wheel window. Sash, The frame helding the glass in

Sill A principal member placed ben zontally under a structure for a beginner at the bottom of a frame, il o the horizont diplece at the bottom of a door or window opening

window opening
Sleeper A horizontal timber for the
support of flou joists or other timb is
A sleeper will is a low wall to tik
ground floor joists
Soffi The ander surface of estructur
such is in arch accernice a stringing
t yault
Stile A member placet vertically in

Stale A mender placet vertically in panding as a stale on a door. The many verticals are trained munities. Stop. It small stap that holds a window or door in place.

Stretcher. The longest face of a brick Strut A member used in compression in a building that is, one that sustings a pressing It is usually a diagonal incinder (see Frame)

Stud One of the vertical members of a france (e.g. in a timber partition)

Tie. A building unit which holdsother members in tension being the opposite to a strut (See Frame)

Transpt The lateral parts of a church, between the mare and the chound which extend beyond the walk of the structure glying it the form of a cross

Transom Beam or bar of word, stone or metal laid horizontally across a doll

or window

Tread. The horizontal member which the foot rests in a stair step Trim. The woodwork or nittalwork used for the interior finish of a room

Trimmer A timber at the side of a framed (or trimmed ') opening that butts into and is supported by a tilin ming joist. The trimmer carries the ends of trimmed or tail." joists, as it a fireline opening. a Areplace opening

Trues A framework of timbers or steel, braced to resist the strains of pressure and pull, as a root-true. In its amplest form the lafters, king-post and tie beam of a house roof (See Frame.)

Argonauts. (ik. heroes who captured the Golden Fieces, 1-226; and Theseus, 7-269.

Argonae. Wooded region in N.E. Franco, in 1st World War. 7-483.

Argos, Greece. Anc. city 20 m. s. of Corinth.

Argosy. Originally, merchant ship of Ragnaa (Argonse); now, poetically any richly laden vessed.

Argus. In Gk. myth., a mouster with 100 cyes of which only two slept at a time.

Too eyes of which only the faithful dog of Odysseus, 5-503.
Argyli, John Douglas Sutherland Campbell, 9th Duke of (1845-1911).
Gov-sen of (anada (1878-83)) long known as Murquess of Lorne; nutried Princess Louise, daughter of Queen Victoria.

Assolishire. Second largest Scottish only.

Argylishire. Second in rest Scottish co.; area 3,110 sq m; pop. 63,270; co. tn. Inverary, 1-227. Aria, in opera, 5-513 See also Musical Terms (table).

Terms (table).

Arladne (arlad'ni). In Gk. myth.,
daughter of Minos, king of Crete;
helped Theseus to flud his way out
of the Minotaur's labyrinth 7 268.
Descrited by him on Naxos, she wafound and married by Dionysus.

Ar'ianism. The doctrine, repudiated
by early Christian Church as heresy
that the Son is finite and created
by the Father; founded by Arius
1-101.

by the 1–101.

by the Father; founded by Arms 1-101.

Arica farc'kal. Spt. in N Chile; pop 13,100: large trade with Bolivia.

Aricl. Fairy sprite, chief servant of Prospero, in Shakespeare's The Tenned 7 256.

Aries [a'ric] or Ram. Sign of the Zodine, 7 524 filus

Arion 'arion', in Gk. myth., poet museam, who saved his life, when forced to jump into the sea, by charming the dolphins with song.

Ariosto (arios to), Ludovico (1471-1533). Ital. epic poet; Orlande Ferroso, 4 329; portrait, 4 330.

Aristides [arist'[dez] (c. 550-467 B.C.)

Atheniam soldier, 1-227.

Aristip'pus (c. 430-360 B.C.). Gk. philosopher, pupil of Sacrates, € 160

Aristoph'anes (c. 445-385 B.C.).

3 116

3 116
Aristotle (384 322 B.c.). (ik. philosopher, 1 228; work and influence 4–94; treatise on thetoric, 6 390; and medleine, 5–161, 1–143; on philosophy, 6 158; theory of atoms, 1 299; and four clements, 1 95. os pupil of Plato, 6–222; as zoologist, 7–526; and Alexander the Great, 1 98. 7-52 1 98

Arita ware (Jap. pottery). See Hizen ware.

ware. Arihmetic, 1 237; addition, 1-16, division, 3-96; factors, 2-335; fractions, 3-228; multiplication 5-203; percentage and interest 6-122; subtraction, 7-177. Symbols

5-203; percentage and interest 6-122; subtraction, 7-177. Symbols see Algebra.

Arithmetical progression, 6-532.

Arius (256-336). Alexandrian theologian, founder of Arianism, 1 101.

Arizona. 48th state of the U.S.A.

Area 113,910 sq. m.; pop. 749,587

tue. 55,000 Indians); cap. Phoenix; 1 238; Grand Canyon, 4 60.

Arizonite, an ore of titanium, 7 282.

Arkaing, Loch. Fresh-water loch Inverness-shire, Scot., 4-275.

Arkansa [pron. ark'ansaw]. State of the U.S.A. Area 53,100 sq. m.; pop. 1,900,000 (one quarter are Negroes), cap. Little Rock, 1-239.

Arkansar River. Largest Missispip affluent except Missourl; rises in Rocky Mts., flows s.E. 2,000 m.. 1-230.

Ark of the Covenant. Chest contuming

Ark of the Covenant. Chest containing the laws given to Moses on Mount

Sinal
Ark Royal, H.M.S., Lord Howard's
flagship, 3-277 flus. The 2nd Ark
Royal (1914) was a seaplane carrier
The 3rd, an aircraft carrier was
ompleted 1938, torpedoed 1941.
The 4th, also an aircraft carrier
was inniched in 1950.

Arkwright, Sir Richard (1732-92), inventor of the spinning frame. 1-239, 7-136; machine compared vith spinning jenny, 4-132.

Aries [aril, Fr. Important in. In Roman times, anc. Archite; remains of huge Roma, amphitheatre; pop 32,400; ou Rhône riv., 6-396.

Arlington, Virginia, U.S.A. Vil. on Potomae r.; national cemetery and burial place of America's naknown soldler who fell in the 1st World Worl Arm, bandage for fracture, 3-366 films.

soldler who fell in the 1st World Wor Arm, bandage for fracture, 3-366 fillist, Armada, The Spanish (1588), 1 240 and naval watfare, 5 351; superiority of Eng. ships, 7 29; decline of Sp. power after defeat, 1 135; Elizabeth I and, 3-231 benearly signals, 7-51.

1 135; Elizabeth I and, 3-231 beacon signals, 7-31.

Armadillo. Armour-clad burrowms animal, 1 241; foot, 3-413 filus. Armageddon Johnaged'onl. Batth field mentioned in Rev xvi, 16 where final struggle between good and evil is to occur on Judgment Day; hence any great battle; supposed site in Palestine, 1 112.

Armagh. Co. and town, Northern Ireland; pop. (town) 9,000; (co.) 111,000, area 489 sq. m. 1-242.

Armagh. Thomas (1867 1918). Arner, inventor of the Vitascope, an early cinematograph projector, 2 392.

Armature. In electrical engineering, that part of a machine which corries the winding connected to the exyternal supply and in which the principal e.m.f. is induced. The term is usually limited to the rotating part of a D.C. machine. In magnetism; (a) a body made of ferromagnetic material stranged in such a way as to be displaced by the magnetic action of an electromagnet; (b) a prece of ferro-magnetic material placed against the ends of a permonent magnet as a keoper; in dynamos, 3-113 with illus; in electric motor, 5-275

Armenia. Country, south of the Quicasus mis, now divided between

electric motor, 5-273
Armenia. Country, south of the Caucasus mts., now divided between Turkey Persia and Russia. 1 242.
Armenia. Smallest republic of the USSR.; area 11.640 sq. m.; pop 1,300,000; cap. Erivan. 1 243; 6 477
Armentières lahrmahntiar'l. Fr. mtg. and border tn. on r. Lys; pop 24,000; in 1st World War was Albed anchor to s. dank of Ypres salient until captured by Germans in April 1918.

Armin'ianism. A predestination, depend on ac A doctrine of modified predestination, making salvation depend on acts of individuals formulated by Jacob Arminiis (Dutch, Harmensen) (1560-1609) (Dutch, Harmensen) (anti-Calymet theologian

(Dutch, Harmensen) (1560-1609)
anti-Calvinst theologian

Arminius the Cheruscan. See Hermann.
Armistice. A cessation of hostilities;
and 1st World War 7-183.

Armistice Day. Day of remembrance observed on Nov. 11. between two World Wurs. 6-383 See Remembrance Day.

Armour, Jean (1767-1834). Wife of Robert Burns 2-132.

Armour, 1-243.

Armour, 1-243.

Armour plate, discovered from meteor at composition, 5-181.

Arms (weapons). See Anti-airorati Artillery; Archery Artillery; Army; 2'omb; Explosives; Firearms; Flying Bomb; Gulded Missiles; Machine-gun; Mines in Warfare; Navy; Rocket.

Arms, in heraldry, 4-165.

Arms, College of. See College of Arms.

Arms.
Armstrong, William George Armstrong
Baron (1810-1900). Brit. solicitor
and engineer; invented the hydraulic crane and other mechanical
appliances; also the Armstrong gun;
founder of important ordnance and
shipbuilding works at Elswick
Northumberland

Army, 1-245; cadets, 2-158
8-128 illus. personal
1-243 244; regimental
2-465; rocket brigades,
Rom. legion 4-475 armour colours 6-421

Army Air Corps. Beit, army unit (1942-47) comprised the Clider Pilot Regt., the Parachute Regt., and Airborne Infantry Units, 1-252.

Army Cadet Force (Brit.) Preservice Army training organization for boys of 14 to 18 yrs. 2-153.

Army Corps. Division of an army, first introduced by Napoleon, the composition varies, but usually it consists of about 10,000 officers and men.

composits of about 10,000 officers and men.

Army Council. Controlling body of Brit. Army, 1-253.

Arns, Thomas Augustine (1710-78)

Brit. inusical composer, works include oratorios, operas, operatas; best known for his "Rule, Britannia." in The Masque of Altred; and Brit. national authem, 5-326.

Arnhem. Th. in Netherlands on rix Rbine; pop. 103,317, 5-370.

Arnhem. Battle of, 1 253, 7-195.

Arnica. A genus of flowering plants of family Compositae, tound in N. Europe and W. part of U.S.A.; tincture a household remedy for sprains and brilises.

Arno. R. of It., rises in Aponnines, flows 150 m. to Mediterranean, through Florence and Plsa, 4-304.

Arnold, Matthew (1822-88). Eug. poet and critic; son of Thomas Arnold; 1-254, 3-291.

Arnold, Thomas (1795-1842). Hendinuster of Ringby School and educational reformer, 1-254; influence on education, 6-503, 3-166.

Arnold of Bressia [bresh'a] (c. 1100-55). It. priest and reformer; preached against vices and riches of clergy; led revolt against papal rule in Rome; executed in instigation of Advan 1V.

Aromatic compounds, in chemistry, 2-319, 321 diag.

Aromatic compounds, in chemistry, 2 319, 321 diag.
Aromatic coils, give flavour to spices

132. Ss. Noted health resort in canton nearly 6,000 Grisons, Switzerland; nearly 6,000 ft. high, pop. 1,800. Arpoggio. See Musical Terms (tuble). Arquebus. An early hand gun, 3-357,

354 illus.

Arrack. Alcoholic drink made in India and Far East, distilled from palm toddy. Jap. viriety is called sake. Arran. Isl. of Butgshire, Scot., noted

to igneous rocks and beautiful scenery; largest isl in Firth of Clyde (165 sq. m.); pop. 4,500;

Arran Banner. Variety of potato, 6-273 Arran Pilot. Variety of early potato,

Arran Proc. Variety of entry potato. 6 273.

Arras [ar'ah]. City in S. France cap, of dept. of Pas-de-Calais on 1. Scarpe; pop. 26,000; strategic point in 1st World War, when ancient town hall and rath, were destroyed; in Second World War, Brit. h.q. of 1939 40, liberated. 7 495.

Arras. General term for tapestry, 7 226.

Arrhenius [ara'thins], Syante (1859-1927). Swedish chemist and physicist; originator of the ionic theory of electrolytes; Nobel prize-winner (1903); advocate of theory that the energy of the world is self-renewing Arris. See Architectural Terms.

Arrol, Sir William (1839-1913). Brit. engineer, contractor and politician; head of firm which built the Tay, Forth and Tower Bridges and Manchester Ship Canal.

Arromanolies, Fr. vil. in dept. of Calarados Novementar, 7 m. N. F. of

Manchester snip Cund. Arromanoles, Fr. vil. in dept. of Calvados, Normandy, 7 m. N.E. of Bayeux; Mulberry Harbones, 5-292 Arrow. In archery, 1-207. Arrow. Riv. of Herefordshire, Eng..

4 168. Arrowhead, Phont, 2-24 illus, f., 7-430

rrowroot. Starchy powder obtained from roots of W. Indes and trop. Amer plants: an invalid food. name comes from S. Amer. Indian use for wounds made by poisoned Arrowroot.

Place for manufacture Arsenal. Chorles storage of armaments; Chorles (Lanes) supplements Woolwich as principa Royal Arscual

Arsenal. Famous Association football club with h.q. at Highbury, London; First, Division champlons in 1931, 1933-35 1938, 1948, 1953.

Arsenie (As). A highly poisonous element of the nitrogen group; atomic weight, 74 91; occurs chiefly as sulphides; does not melt but volatili es at 212° F.; used in mfr. of lead shot, rat poisons, insecticides, etc.; 3 224; and antidote, 6-236.

Art. See Fine Arts. For careers in Art see Commercial Art.

Artaxerxes of Ardashir, the Sassanian. King of Persia (3rd cent. A.D.); and revival of Persian rule, 6-131.

Artaxerxes I. King of Persia, son of Xerxes I, ruled 46; 424 B.C.

Artaxerxes II. King of Persia 404 358 B.C.; succeeding his father Darlus II; life told by Pintarch.

Artaxerxes III. King of Persia 358-338 B.C.; weak and despotic ruler.

Artemis. (ik, goddess of hunting; identified with Rom. Diana; there were other goddesses called Artemis, of a different character, 3 %6; and Iphigenia, 1 67.

Artemisum. Region on N. coast of Eubosa, isl. in Aegean Sea; naval victory of Gks. over Persians.

Arterial blood, and oxyhaemoglobin,

480 n.c.
Arterial blood, and oxyhucmoglobin,
1 489.

Arterial blood, and oxyhacmoglobin, 1 489.
Arterial blood vessels; heart and circulatory system, 4 143; in early medical theory, 1-492.
Artesian Well, 1 254; 7-139.
Artevide [artevel'de]. Jacob Van (c. 1200-1315). Elemish leader in revolt of them (1337) against Count of Flanders. His son Phillip (1340 82) was killed in similar revolt.

OUR letter B seems to have started its career in the shape of a crane (bird), in Egyptian picture-writing. Presently the Egyptian scribes gave it a simpler form, which resembled the outline of a tent. So when the Phoenicians and Hebrews took the symbol into their alphabets, they named it Beth, which means "house." The Phoenician form of the letter resembled a tent supported by its pole, but some of these early B's or

Beths, it seems, were more aristocratic than the tent Beths, for Dr. Isaac Taylor in his story of the alphabet says: "Other forms suggest . . . a two chambered eastern house (notice that our big B has two rooms) with the mon's apartment on one side and the women's on the other.' In sound B is closely related to p, f, v and m. Martial. the Roman wit, said of the Spaniards, who pronounce b as v and v as b, that rivere (to live) was bibere (to drink).

Baal [bāal]. Semitic name for a lord, master, or god; especially sun-god of Camaanites and Phoenicians, 6–161. Baalbek. Anc. Syrian city famous for Rom. ruins, 4–473; called Heliopolis by Gwesky

by Greeks.

IN the hieroglyphic the hieroglyphic writing of ancient Egypt C was a throne In its simplified torm it looked more like a camel with its hump Cos. The Phoenicians and Hebrews called it gimel, which was their word for "camel," and wrote it 7 Among the Greeks gimel became gamma. By this time the camel had turned round and the hump had become a right angle, so that it looked like this: Then gradually it became transformed into the rounding letter C. Its sound was a hard g (as in "go"), but the Romans afterwards gave it the sound of k. In Angle-Saxon or Old English, c had the sound of k, but it was gradually changed to ch before e and i. In the English of to-day it still has the sound of k before a, o, u, and before any consonant other than h Before e, i, or y it has the sound of s or sh. Followed by h it has either the sound of k or a softer one, as in chop

Cab. Horse-drawn or motor-driven vehicle licensed to carry passengers for profit. First cabs in Gt. But. were two-horsed backney coaches, introduced in London, 1820, 6-412 Cabal (kabal'). Unpopular Eng. ministry (1867-73) under Charles II composed of Chifford, Ashley, Buckingham, Arlington, and Lauderdale, whose initials formed the word: see Cabala below.

whose initials formed the word: see Cabala below.
Cabala, The. Mystical interpretation of Scriptures, 4-151.
Cabaliero, Francisco Largo (1869-1946).
Spanish labour leader. Fremier in Popular Front Ministry 1936 37;
after Spanish Civil War settled in France; Imprisoned in Dachau by Germans during 2nd World War; died in Paris.
Cabbara. Vegetable: cultivated vale-

Cabbage. Vegetable; cultivated varie-ties incl. cauliflower, broccoli, kales, 2-151; cooking of, 2 198. Cabell, James Branch (b. 1879). Amer.

2-151; cooking of, 2 198.

Cabell, James Branch (b. 1879). Amer. writer, who made a reputation as a satirical novelist. 7-365.

Cabinet. In purifamentary govt., 2-151, 4-3; and Privy Council, 6-292.

Cabinet-making, as a career, 2 231.

Cable. In telegraphy 2 152; cablese, 2-442; composition of, 2-155, 1-129; first Atlantic cable, 5-395; grid cables, 3-218; wire cable in bridge-building, 2-67; for telephony, 7-240.

Cable and Wireless Ltd. Brit. cable co., formed 1929, operating a great overseas and Empire network; U.K. assets taken over by Post Office in 1949, 2-155.

Cable-laid rope, 6-452.

Cable railway, 6 359.

Cabot, John (c. 1450 98). Genoese explorer, 2 156; voyage to Canada, 2-197; discovery of Newfoundland, 1-134, 5 395; and Bristol, 2-73.

Cabot, Sebastian (1474-1557). Son of John Cabot, with whom he sailed in 1497; expedition to S. Amer., 1-134, 1-225.

Cabral or Cabrera, Pedro Alvarez (c. 1460-1526). Dont

1-225.

Cabral or Cabrera, Pedro Alvarez (c. 1480-1526). Port. navigator, bound to E. Indies, accidentally carried of course to Brazil (1500), 1-132, 2 19.

Cabrera, one of Bulcaric Isles, 1-349.

Cabrini, Maria Francesca (1850-1917). Italo-Amer. missionary and saint, known as Mother Cabrini; canonised 1948, the first Amer. saint.

Caono Ikukāōi. Tropical Amer. tree whose seeds yield chocolate and cocoa, 2-438, 439. See also Cocoa and Chocolate.

Cachalot or Sperm Whale. One of the

and Chocolate.

Cachalot or Spern Whale. One of the largest members of the whale family, grows to 60 ft. long. The head yields up to 300 gallous of spermacoti, and blubbor from the body sperm oil. Ambergris obtained from the intestings, 7-445, 446 illus, Cactobiastis. Cactus-cating insect, 2-157.

Cactus. Leafless desert plant, 2-187; types of, 2-161, 162 illus. f., 5-336 illus.; modification of growth, 6-217; moisture conserving spines, 4-470 illus.; 3-319; and cochineal insect, 2-436.

Cadbury. Firm of Eng. cocos and chocolate mfrs.; works at Hournville, 1-473; cocos powder, 2-439; as Quaker firm, 6-317.

Cad'bury, George (1839-1922). Brit. business man and philanthropist of Quaker family; chief proprietor of the cocoa firm of 'adbury Brothers at Bournville, where, with his brother Bishead, he formulated as madel with Richard, he founded a model suburban towu.

Cad'dis fly. Insect of order Trichop-tern. ('addis grubs live on the bottom of streams and ponds, in cases made of pieces of stick, sand, or even tiny shells. In these they move cven tiny shells. In these they move about and pupate, finally emerging as 4-winged, moth-like creatures. Cade, Jack (d. 1450). English rebel, 2-158, 4-163, 4-399. Cadence. See Musical Terms (table).

Cadency, marks of, in heraldry, 4-164

Cadency, marks of, in heraldry, 4-164 illus. f.
Cader Idris, Wales. Extensive mt. ridge in Merionethshire; Pen-y-gader, 2,927 ft., its highest penk, 5-174 illus., 175.
Cadet. Youth undergoing military training, or training for commission in armed forces Armed forces, 2-158; in Royal Navy, 5-357.
Cadi. A judge in a Mahomedan court; in Algeria, 1-109.
Cadiz. Sp. spt. and naval station on Atlantic, 50 m. N.w. of Strait of Gibraltar; pop. 100,249; 7-104; founded by Phoenicians, 6-161; Drake's raid, 3-114.
Cadmium (Cd). A metallic element of the zine group; atomic no 18; atomic weight 112-41; used in the Weston standard electric cell; found in zinc ores and as Greenockite; melts at 320-9° C.; named after cadmia, the Latin name for the zine ore calamine, 3-224; in atomic pile, 1-301; in Wood's metal. 1-114.

Latin name for the zine ore calamine, 3-224; in atomic pile, 1-301; in Wood's metal, 1-114.

Cadmus. In Gk. myth., brother of Europa, 3-122; mythical founder of anc. Thebes, 7-266.

Cadegan (kadu'gan), Sir Alexander (b. 1884). Brit. diploinat; perm. undersec. of state for toreign affairs, 1938-46; perm. U.K. representative on U.N. Security Council, 1946-50, Awarded O.M. in 1951; chairman B.B.C., 1952.

Caduceus, staff carried by Moreury

Caduceus, staff carried by Mercury,

5-173.
Caedmon [kadmon] (d. c. 675). Earliest English Christian poet, 2-159, 1-442.
Caen. Tn. of Franco, cap. of Calvadog dept.; pop. (19.4) 67,851, 2-160; William the Conqueror and, 5-449.
Caerleon. Town in Monmouthshire, on r. Usk; as Isca Silurun, Rom. station; traditional site of Camelot, seat of King Arthur's court.
Caernarvon. Co. tn. of Caernarvonshire, Wales; pop. 9,255; castle, 2-260 illus.

illus.

Caernarvonshire. Co. of Wales; area 569 sq. m.; pop. 124,074, 2 160.

569 sq. m.; pop. 124,074, 2 160.

Caesar, Gaius Julius (102-44 3.C.).

Rom, general, state-man and author,
2 161; 6 433; expeditions to Trit.,
2-73, 3-275; and Brutus, 2-101;
reforms calendar, 2-174; and Cloopatra, 2-407; foundation of Lille,
4-506; and Antipater, 4-375; and
Pompey, 6-258; prose style, 4-450.

Caesar and Cleopatra (1898). Play by
George Bernard Shaw; modern style
dialogue, 7-19.

Caesarea [sēzorē'a] or Caesarea Mazaca Anc. town in Asia Minor; cap. of kings of Cappadocia; destroyed by Persians A.D. 260; pop. then 400,000, modern town, Kaisarlych.

modern town, Kaisarivch.

Caesarea or Caesarea Palestina. Spt. m anc. Palestine on Mediterranean 55 m. N.W. of Jerusalem; built by Herod; modern village. Qisanaya, has many Rom ruins.

Caesarea Philippi. Anc. town in Palestine on r. Jordan at foot of Mi Hermon; here Jesus gave his change to Peter (Matt. xvl. 13).

Caesium [552]um] (Cs). Metallic element of the alkali metal group atomic no. 55. atomic weight, 132 91 found in the lare mineral lepidolic melts at 28 45° C; 3 224, 1 112 named from the Latin caesaus, blush grey, owing to the colour it gives to

mens at 2813 C.; \$ 221, 1 112
named from the Latin caesius, bluish
grey, owing to the colour it gives to
a flame.

Caffeine. Alkaloid extracted from tea
coffee, or prepared synthetically from
theobromine. Used as heart sim
ulant; in coffee, 2 114; 7-232, anitrogen compound, 5-143.

Cage birds, canary, 2 207; in China
2-367 illus.

Cagliari [kahl'yahrē]. It., cap of
Sardinia, on s. coast; pop. 111.573
Rom. amphitheatre, fombs, and
other remains of antiquity, 6 199
Cagliostro [kahlyōs'tro]. Alessandro
(1743-95). Assumed name of
Gluseppe Balsamo, It. charlatan, in
plicated in the Diamond Necklac
affair, 1-95.

Cagoulards [kagöblahr]. Fr secret
pro-fascist organization of the years
before and diving 201 World World

pro-fascist organization of the years before and during 2nd World War So called from their custom of wear

pro-fascist organization of the venibefore and during 2nd World War
So called from their custom of weat
ing hoods when they met, to had
their identities. Believed to be not sponsible for bomb outrages and
murders, in Paris, 1937.

Caiaphas [ki'afas]. Jowlish high priest,
before whom Jesus was arraigned
before the crucifixion (Matt. xxvi. 3,
57); John xviii, 13-14, 21, 28); and
who figured at the examination of
Peter and John (Acts iv. 6).

Caicos Islands. Group of isls., geo
graphically part of the Bahamas, but
with the Turks Isls, form a depen
dency of Jamaica, 4-338.

Caillaux [kah'yo]. Joseph Marie Augusto (1863-1944). iFr. premier
1911-12; imprisoned 1917-20; ban
ished, 1920-25 for collaboration with
the Germans; his wife in 1914 killed
Gaston Calmette, editor of Figura.
for printing attacks on Caillaux.

Cain. Adam and Eve's Erst-born son.
jealous slayer of his Brother Abel
(Gen. iv.).

Caine. (Sir Thomas Henry) Hall (1853
1931). Brit. novelist, absociated with
Isle of Man. Stories melodramatic
with strong religious tone (ImMunzman; The Caristian), 5-111.

Caincoole era. In geology, latest main
division, including Tertiary and
Quaternary eras, 3-515, 516.

Cairm Braeriach. Highest point of the
Grampian Range (4 248 ft.), 4-275
Cairagorm. Range and peak (4,084 ft.)
of Grampians, Scot.; gives name to
yellow or brown variety of quant
found here and olsewhere. The

dirk-handles, etc., 1-361, See also Stones, Presious brooches, di 6-320. See

(table), Cairns. Spt. of Queensland, Australia; exports gold, copper, tin, silver, timber and coffee; pop. 15,000; 6–324. Cairnsmore of Carsphairn. Mt. in Kirkendbrightshire, Scot., 2,612 ft.,

4-115.

Gairnsmore of Fleet. Mf. in Kirkeud-hrightshire, Scot., 2,331 ff., 4-415.

Cairn-Terrier. Small Scottish long-haired dog, 3-100 illus, f.

Cairo. Cap. of Egypt; pop. over 2,000,000, 2-163, 1-50; universities, 3 182, 5 89.

Caisson. Chamber of wood, concrete or metal, with water-tight walls, used in laying underwater foundations of quays, bridges, etc.; dry dock gates, 3 100; in Mulberry harbours, 6-290.

Caithness. Co. of Scot.; pop. 22.705:

quays, bridges, etc.; dry dock gates, 3 100; in Mulberry harbours, 5-290. Caithness. Co. of Scot.; pop. 22,705; area 685 sq. m.; co. tn. Wick, pop. 7,161, 2-165.
Caius [RC2], John (1510-73). Eng. physician; attended Edward VI, Mary I and Elizabeth I. In 1537 refounded Gonville Hall, Cambridge, as college of Gonville and Calus.
Cake, cooking of, 2 407.
Cal abash. African gourd. The fruits are enclosed in a shell used by the natives for drinking cups and other domestic utensils.
Calabria [kali'bria]. Name, until 11th cont., of s.E. it. (the heel); now dept. in s.w. (the toc); a. 5,819 sq. m.; pop. 1,907,900; 4-304.
Cala'dium. Ornamental plant of S. Vuer. with large "arrow-head" leaves and an passages in .m. Calass. Fr spt. on Stratt of Dover; pop. 50,048, 2-166; in Hundred years' War. 4-204; lost to England 5-110; Ger. occupation 1940, 7-187.
Cal amine. A zinc ore, a translucent brittle nuneral, carbonate of zinc; also applied to a zinc silicate found a son intel with the carbonate (latter sometimes called smithsonite).
Calanus finmarchicus, nucroscopic soa annual, 1-450 illus.

Calanus finmarchicus, microscopic soa anunal, 1-450 ilius. Calcarea. Class of sponges with limy

Calcarea. Class of sponges with limy skeletons. Calceolaria. Garden plant of the Scraphulariacear, with yellow, red and brown bell-like flowers; named from Lat collections. Small shoe.

and brown bell-like flowers; named from Lat cale colus, small shoo. Galoite Ikal'sil. Calcium carbonate. Crystal refracts light doubly, so is used in Nicol prisms for the polarization of light; 3-4 illus. Calcium and its compounds, 2-166. A white metallic element of the alkaline carth metal group. Chem. symbol Ca; atomic weight 10 03; 3 221; in bones and teeth, 3 -109; parathyroid control of, 4-28; calcium carbide, 1-9; 2-166; calcium carbonate, 2-166; 4-508; calcium chloride, 2-166; 4-508; calcium choride, 2-166; calcium hydoxide, 4-508, 1-9, 1-112; calcium oxide, 4-508; calcium phosphate, 6 162, 5 177.

oxide, 4-508; calcium phosphate, 6 162, 5 177.
Lalculating machine, 2-167, 1-238

talculating machine, 2-167, 1-238 with illus.

Calculi. Chalk-like stones sometimes formed in the kidneys, 4-403.

Calculus, in mathematics, 5-118; invented by Newton, 5-408.

Calculus, Principal city of Western licugal, India. Pop. (with Howrsh) 1,000,000, 2-172, 1-365, 4-241.

Calculta Cup. Trophy awarded to the wilning country in the annual England v. Scotland International Rugby football match; presented by the Calculta R.F.C. in 1879.

Calder Hall. First Brit. power station in on nuclear energy; nr. Scilafield, (imberland, 1-302, 3-10.

Calderón [kahldáron] de la Barca, Pedro (1600-81). Span. dramatist, 7 122, 3-119.

Calche. Four-wheel horse-drawn carrage; still used in Quebec, 6-322.

Calcdonia. Name given by Romans to votiand; now used poetically.

Laledonian Canal, Scot., 6-511, 4-275, 286.

Calendar, in reckoning time, 2-174;

dendar, in reckoning time, 2-174; Vec, 1-332; almanacs, 1-117; re-nn by Caesar, 2-163; Christian

calendar, 4-363; days of week, 3-55; Fr. Rev. calendar, 3-469; Mayau calendar column, 1-331 illus, 6, month, 5-255; New Year's Day, 5-409; Red Indian, 6-373 illus, Calender, in paper-making, 6-71. Calendared rubber, process, 6-465, Calendula officinalis. See Marigold, Calf. Young of cattle, 2-274. Calf. Type of leather, 4-469 illus, Calgary, Alberta, Canada, Lending in-

Calgary, Alberta, Canada. Lending in-land city of Canadian N.W.; pop. 129.060, 2-175. Cali, Colombia. Commercial centro in

Cali, Colombia. Commercial centro in s.w. on branch of Cauca; pop. 140,000; rly. to Pacific port Buena-ventura; 2-458 illus. Caliari. Nec Veroness, Paolo. Caliban [kal'iban], in Shakespearo's Temper, deformed savage son of a witch and a devil, enslaved by Procuper.

rospero.

a witch and a devil, enslaved by Prospero.

Calibre, in measuring bore of artillery, 1-259; of rifles, 3-360.

Calico. Cloth, 2-410.

Calico. Cloth, 2-410.

Calico. Cloth, 2-420.

Calico. Spt. on Malabar coast, Madras, India, 4-240, 5-70

California. State of U.S.A.; area 158,693 sq. m.; pop. 10,586,223; cap. Sacramento, 2-177; Ioo Angeles, 5-38; gold rush of 1818, 4-39; basketry, 1-370; eltrus oils, 6-123; introduction of Smyrma fig. 3-351; raisins, 6-361; ladybirds and pest fighting, 4-136.

California, Gulf of. Arm of Pacific Occan 710 m. long between Lower California and mainland of Mexico.

California, Lower or Baja California.

Peninsula of Mexico botween Pacific and Gulf of California and Colorado r., 55,000 sq. m.; pop. 95,000.

r., 55,000 sq. m.; pop. 95,000. Californian incense cedar. Tree; wood

used for pencils, 6 113.

Californium (Cf). Chem. clement; atomic no. 98; atomic weight 211; 3 221.

Caligula (A.D. 12 11). (Inius Caesar, Roman emperor 37-41, 2-178; mad-ness, 6 137. ness, 6 137. Caliper [kal'iper]. Adjustable gauge

Caliper [kul'iper]. Adjustable gauge for measuring small objects. Caliph. Civil and religious head of a Mahomedan state. Title assumed by Selim I in 1517, abolished by Turks in 1924; 7-334, 336. Calix'tus II (d. 1121). Pope, concluded Concordat of Worms with Henry V

Concordat of Worms with Henry V (1122).

Calixtus III (1378-1458). Pope; in Borgia family, 2-17.

Calla lily. See Arum lily.

Callao [kalah'o]. Chief port of Peru, 6 m. w. of Lima; pop. 87,587; cx. cellent harbour; exports sugar, cotton, minerals, wool; 4-507, 6-138, 141

Calligraphy, importance in Jap. art,

Callimachus (c. 300-210 B.C.). cammaenus (c. 300-210 a.c.). Gk., poet; superintendent of library at Alexandria. Is said to have written more than 800 works, but only a few fragment's are extant, 4-94. Callimorpha dominula. Moth, 2-143

Callimorpha dominula. Moth, 2-143 illus.
Calliope [kallopē]. In Gk. myth., Mussof eple poetry, 5-299.
Callisto. Nymph in Gk. myth.; story of, 2-489.
Call money, in finance 1- '1.
Calmar (Swed.). Ner Kalmar.
Cal'omel. Mercurous chlorade, beneficial in liver complaints.
Calorie. A weightless fluid in old theory of heat, 4-145.
Calorie. Unit of quantity of heat. It is the amount of heat needed to raise the temperature of one gram of water to 1° C. 2-433: 4-148; the 15° calorie is defined as the amount of heat needed to raise the temperature of one gram of water from 14-5° C. to 15-5° C. The mean calorie is one-hundredth of the quantity of heat needed to raise the temperature of one gram of water from 0° C. to 100° C. The large calorie, or kilogram calorie, is equal to 1,000 calories, and is used as a measure of the energy values of foods, 3-410.

Calotypes. Early kind of photographs made by Fox Talbot, 6 170.
Calpur'nis. Last wife of Julius Caesar, who married her 59 B.C. She pleaded with him not to attend the senate (following a disturbing dream) on March 15, 44 B.C. She appears in Shakespeare's play Julius Vaisair.
Caltanissetts. City in Sicily; pop. 50,500.

50,500.
Calumet. See Pipe of Peace.
Calvary. Hill outside Jerusalem, seene
of the Crucifixion of Jesus, 4 367.
Calverley, Charles Stuart (1831-81).

of the Crucificion of Jesus, 4 367.

Blennial flower of Emily Campanulaccae; blossoms white, blue, rose; height about 3 ft. Canterbury Plains. S. Island, New Zealand; sheep-rearing, 5-422. Canterbury Tales, The. Series of tales in verse by Geoffrey Chaucer, 2-311; stories refold, 2-312, 313.
Cantharidin. Medicinal substance procured from blister beeble, used for raising blisters on skin, 1 415.
Cantilever, in bridge construction, 2 61 with diag.: 2-64 with illus.
Canton or Kwangchow; cap. of Kwangtung prev., China; pop. 2,100,000, 2 214.
Canton. Name for an admin, division in Swiftz and Weight Swiftz canton.

2,100,000, 2 214.

anton. Name for an admin. division in Switz, and Fr. In Switz, cantons are states of the federation. In Fr., word is used for a much smaller area, midway between a parlimentary division and a parsh. Fr. has about 3,000 cantons, Switz. 22.

Canton River. Also called Chu-kiang ("Pearl River"), main channel of the delta formed by the Si-kiang. Canute (c. 991-1035), King of Denmark. Norway, and England (1017-35), 2 248-2-276

Norway, and England (1017-35), 2 215, 3-276. Canyon [kan'you]. Type of river valley with precipitous sides, 6-188; Grand

with precipitous sides, 6-188; Grand Canyon, 4-60.
Canzonetta. See Musical Terms (table).
Caoutohous tree (Hera brasilians), the tubber tree; plantations, 6-464.
Cap. Type of hat, 4-136.
Capablanca (kupublang ka).
José
Raoul (1883-1942). World-famous cliess-player, a native of Cuba; gained world title in 1921, 2-328.
Canadianca. The property of a hody

gamea world title in 1921, 2-328.

Capacitance. The property of a hody
by virtue of which a quantity of
clectricity has to be impaired to it
to raise its potential above that of
the surroundings. The capacitance
between two bodies is the ratio of
the charge to the potential between

the charge to the potential between them. In a capacitor (condenser) capacitance is the quantity or charge of electricity on the positive plate, 6-310 illus, 7.

Capacitor or Condenser. Piece of electrical caulpment consisting of two conducting plates separated by a layer of insulating material (the dielectric). When a voltage is applied to the plates, the latter accumulate and store a low voltage charge; this is called the capacitance and varies or is variable according to the type. Capacitors used in radio circuits or is variable according to the type. Capacitors used in radio circuits generally have air or paper dielectries and their capacitance is varied by altering the distance between the plates. A storage battery is a form of capacitor; 3 215. 4 259.

Cape Breton Island. Canada. Separated from Nova Scotia by Strait of Canaso, 5 169; Cabot's discovery, 2 156.

Cape buttalo, 2-169.

Cape Cod, Massachusetts, U.S.A. L shaped peninsula between Nantucket Sound and Cape Cod Bay. 144; landing of Pilgrim Fathers, 6-201.

Cyrus the Younger (d. 401 B.C.). King of Persia.

Cytherea (sithere'a). Name given to the goddess Aphrodite from her island of Cythera.

Cytology. Study of living cells, 2-287, 2-25.

Cytoplasm. Protoplasm surrounding

Cytoplasm. Protoplasm surrounding

the nucleus of a cell, 6–298. Czarniecki (charnyet'skl), Stephen (1599-1665). Polish general; drove Swedes finder Charles X from Poland,

Swedes finder Charles X from Poland, and restored kingdom to King John Chsimir (1655-57).

Czechoslovakia. State of cent. Emrope; area 19,381 sq. in.; pop. 12,109,000; cap. Prague. 3 21, 7-483; Germany and Sudetenhand. 3 318, 4-10; Henes. 1-428, 7-486; Masaryk, 5-113; and 2nd World War. 7-486; flag, 3-384 illus. f.; costume, 2-351 illus.

Czechs (Bohemans). Slavie racegroup. 7-66.

Czenstochowa [chenstöhöfa]. Polish holy city, 65 m. N.W. of Cracow; pop. 120,000.

120 000

Czernin (cher'nın). Ottokar, Count (1872 -1932). Austro Hungarian statesman : at outbrenk of 1st World War tried

at outbrenk of 1st World War fried to win over Rumania to Central Powers; as foreign min., (1916-18) sought to save Austria-Hungary. Czernowitz. Nec Cernauti. Czerny (Isérpie), Karl (1791-1857), Austrian pianist and composer; teacher of Lazzfand Thalberg; exer-cises for pianoforte still widely used.

N Egyptian picture-writing the symbol corresponding to our letter D was a hand . When conventionalised, it looked like this , and later, among the thoeni ians, became a triangle with a short tail **4**, the tail in time being dropped. The Phoenicians called it dulcth, which means "door" (remember the primitive house was a tent and the door simply a triangular curtain hung in front of the opening). The name and form of

Marine flatfish common in European waters, except Mediterra-nean. Length 10 in. Brownish white belo. Both eyes on right side of head. Populur food fish.

head. Popular food fish.
Dab'shiek. Another name for the little grebe; common in Britain.

Da'daism. Movement in art and lit. begun by Tristan Tzara, Hans Arp and others at Zurich, 1916; anarchical, anti-traditionalist and irrational;

ical, anti-traditionalist and irrational; in part an expression of revolt against condition of the world. It moved to Paris where its irrationalism was taken over into Surrealism and used constructively. Dadaism died out about 1922. Word da la (Fr. hobbyhorse) was a random choice as titic. Daddy-long-legs, or Grans-fly, 3-25. A large fly of the family Tipulidae, with very long, thin legs and a narrow, pale brown body. Its larva is the

this letter were adopted by the Greeks with slight variation, and thus daleth became delta: A. The delta of a river gets its manie from its resemblance to the Greek letter delta. For a long time its form did not change greatly, but it showed a tendency to turn over so that its apex was turned to the right. When the sides which met at the 'it were written at one stroke, it became the D with the rounded back adopted by the Romans and used to-day.

"leather jacket" so destructive to lawns and grasslands

Doon. River and loch of Ayrshire, Scot., flowing N.W. 30 m. into Firth of Clyde.

Doone Valley, in Exmoor, made famous by R. D. Blackmore's Larna Doone.

Doorn. Vil. near Amerongen in the Netherlands: 1920-41 the residence of ex-Kaiser William II.

Doppler Effect. Characteristic of most forms of wave motion. In a sound wave, it is the change of pitch or frequency received by an observer, due to relative motion between the hearer and the sound source. Thus the whistle of a moving train appears to be higher in pitch when coming towards the hearer than when going away from him. The same peculiarity holds good for light waves, the frequency of which appears greater to an observer approaching the light source than it does to an observer moving away from it. Doppler's effect was discovered in 1842 by the Austrian physicist whom it was named.

Dor'cas or Tab'iths. Follower of Jesus at Joppa, a woman "full of good works" (whence the "Dorcas socities" of the Church), resied from the dead by Peter (Acts ix. 36-40).

Dykes or dikes. Earth embankments used to protect low lands from flooding by sea or rivers; in Netherlands,

5 372.

Dykhtau. Mt. in Caucasus mts. (17,054 ft.), 2 271.

Dynamits. High explosive consisting of nitroglycerine absorbed in some porous substance such as kieselguhi (a form of clay). Used for blasting, Invented by Alfred Nobel, 1866; 3-329.

3-329.
ynamo. Power-driven machine that converts mechanical energy into electrical energy by the movement of conductors in a magnetic field. The term is more correctly confined to a machine producing direct current, 3-142, 3-212 with diag.; at Buttersoa power stn., 3-217.
yns. The unit of force based on the contimetre-gram-second system. It

at Fattersea power sto., 3-217.

Dyne. The unit of force based on the centimetre-gram-second system. It is that force which, acting on a mass of one gram, given to it an acceleration of one centimetre per second per second, 3-142.

Dys'entery. Intestinal disease accompanied by fever and loss of blood; amoebic form caused by protozea.

Dy'son, Sir Frank (1868-1939). Brit. astronomer; Astronomer Royal (1910-33).

Dyson, Will (1880-1938). Australian cartoonist. Worked on Daily Herald, London, 1913-25, 1931-38; 1-321.

Dyspesium (Dy). Rare earth chem. element; atomic no. 66; atomic weight 162-46; 3-224.

Dyticous (2001. family). See Water beetles.

OF all the letters in the English alphabet E is the one most used: yet the Egyptians and the Phoenicians did not have it in their alphabets. Its ancestor, however, was the Egyptian , which was simply the sign of a breathing. When later it was written it looked like our E turned down. The Phoenicians called it he (pronounced ha), meaning "window," which seems a

good name for a breathing sound, and it has a fairly recognizable likeness to a window in form. The Phoenicians and Hebrews changed the form of it still further, turning the stem up. But they wrote from right to left, and so they faced it towards the left like this . The Greeks, . The Greeks, who wrote from left to right just as we do, turned it round. They were the first people to use it as a vowel

Eadwig (Saxon king). See Edwy.
Eagle. Bird of prey, 3-145, 1 157 lilus.;
eve, 3-333 lilus.; foot, 3-113 lilus.

Edward VIII (b. 1894; acceded and abdicated 1936). King of Gt. Brit., later Duke of Windsor, 3-169. Edward the Confessor (ruled 1012-66). King of Eng., 3-166, 3-276; and Westminster Abbey, 5-19. Edward the Elder (ruled 901-24). Saxon king of Eng., son of Alfred the Great,

king of Eng., son of Alfred the Great, 3-166. Edward the Martyr (ruled 975-78). Saxon king of Eng., 3-166. Edward, the Black Prince. See Black Prince.

Edwardes, George (1852-1915). Brit. theatrical manager: director at the

EDWARD OF WOODSTOCI

Gaisty, London, for nearly 30 years, producing a series of famous musical plays.

Edwards, John Passmore (1823-1911).

Bril. Journalist and philanthropist; gropprietor of the Rcho, a former London evening nowspaper; devoted large sums of money to hospitals, art galleries and libraries.

Edwards, Jonathan (d. 1758). Famous Amor, preacher-writer, author of The Freedom of the Will, 7-363.

Edwards, Jonathan (d. 1758). Famous Amor, preacher-writer, author of The Freedom of the Will, 7-363.

Edwards, bir Owen (1858-1920), influence on Welsh literature, 7-115.

Ed'wy or Eadwig (c. 940-959). Saxon king, eldest son of Edmund I succeeded his uncle in 955; shared throne with brother Edgar.

Est. Elongated snake-like fish, 3-170; instinctive behaviour, 1-152; migration, 5-202.

Efferent nerves, in human body; work of, 5-368.

Eff. See Newt.

Efgan, Pierce (1772-1849). "Father of Brit, sporting journalism"; wrote on races, prize-fights, cock-fights, cicket matches, executions, etc.; Pierce Fon's Book of Sports and Murror of Life; Life in London.

Eg'bert (d. 339), King of Wessex; conquered Northumbria and Mercia; called "first king of the English"; 2-75; and St. Swithin, 6-488.

Egede, Hans (1686-1758). * Norweg, missionary; in Greenland, 1-221.

Egerta [5]e'ria. In Rom. myth, a nymph who inspired Numa Pompilius, 6 429.

Egg, 3-172; coloration of bird's eggs, 1-458, 459; incubation of bird's eggs, 1-458, 459; incubation of birds' eggs, 1-460; embryo of chicken, 3-239 illus, protoin in white of egg, 6-297; of fish, 3-377. frogs, 3-472; of skates and rays, 7-99; of raven, 6-367; robin, 6-416 illus; and Eastor, 3-154.

Egg plant of Aubergine. Annual plant, native t. Asia. Leaves oval, lobed, woolly on underside. Flowers

on man, s-3(f), flogs, 3-472; of castrich, 6-8 with illus; of skates and rays, 7-59; of raven, 6-367; robin, 6-416 illus; and fastor, 3-154.

Egg plant on Aubergine. Annual plant, unaffect 4 sia. Leaves oval, lobed, woolly on underside. Flowers similar to those of the tomato. Egg-shaped fruit, 6 to 8 in. long, purplish colour, is edible.

Eggshell razor. A mollusc, 5-232 illus, f Erham. Tu. in Surrev. Eng.; pop. 24,515; here is Royal Holloway ('oli (London Univ') for Women Eglantine. Not Sweet Briar.

Eg mont, Lamoral, Count of (1522-68). Flomish hero, gov. of flanders and Artols under Philip II of Spain, his unjust execution for treason by Council of Blood gave impetus to the Netherlands revolt; theme of Goothe's Egmont.

Egment, Mount. Peak on N. Island, New Zealand (8,260 ft.), 5-122.

Egoists or Epicureans. A school of philosophers. 6 159.

Egrement. Urban district and town of Cumberlands. Eng., on r. Ehen, 5 m. s. of Whitchaven. Iron ore is mined. Bellafield atomic energy establishment is on cost near by. Pop. 6,000. Also a N.w. suburb of Birkenhead, Che-hire, 4-525.

Egret. Bird of the heron family, 7 168.

Egypt, Ancient, 3-183; types of people. 3-198 illus.; agriculture, 1-71; armics, 1-248; with illus; iron blades used. 4-293; navy, 5-350; ships, 7-28; (ik. astronomers, 1-278; fishing, 3-378; geometry, 3-517; tanning leather, 4-466; medicine, 5-161; status of cats, 2-263; status of wives, 5-135; costume, 2-420, 2-14 illus.; ceremonial false beards, 1-397 with illus.; animal worship and detties, 3-199; burial customs, 3-183, 184, 192 illus.; symbol of the cross, 2-535; dolls in tombs, 3-104; iss, 4-301; mummies, 2-88, 5-295; Ostris, 6-6. Architecture, Paunting, Soulpture; architecture, 1-209; embroidery, 3-237; curiture, 3-40; glass-making, 4-30; hieroglyphies, 4-174; music, 5-30; painting and drawing, 3-194, 195, 199 illus., 6-33; payres.

186-85, 190, 191, 195, 198; temples, 3-185-189 illus.; art in tombs, 3-193; Rosetta Stone, 6-454; writing, 1-120 illus., 7-48; weights and measures, 7-485.

History: Old Kingdom, 3-196; Middle Kingdom, 3-196; New Kingdom, 3-197; as a Rom. province, 1-53; rule in Judea, 4-375; occupation of Jerusalem, 4-382.

Egypt, Modern. Country of Africa; area 386,000 aq. m.; pop. 19,000,000; cap. Cairo; 3-172; map, 3-174; fig., 3-385 illus. f.; racial type, 3-182; cotton-growing, 2-516; education, 3-182; Arab conquest and later, 3-175; Napoleon's campaign and administration, 5-318, 319; protectorate and independence, 1-55; claims to the Sudan, 7-180.

Egyptian Pound. See Money (table).

Egyptiongy. Science of archaeology of Egypt, 1-203, 3-183; Brit. Museum collections, 2-88.

**Ehrenbreitstein [&r'enbrit'shtin]. Ger. Ta. across the Rhine from Coblenz; fortross on rock 400 ft. high, taken by Fr. (1799), restored to Ger. by Congress of Vienna (1815).

**Ehrenburg, Hya 6. (b. 1891). Russ, writer; war correspt. in both World Wars; many stories and novels; The Fall of Parss won 1942 Stalin prize for lik.; 6-481.

*Ehrlich [&r'likh]. Paul (1854-1915).

Ger. bactoriologist. discovered drug.

Salvarsan. 3-127; Nobel prize winnor (1908).

*Eider, type of duck, 3-131, 132 illus.

*Eidel (Iffel]. The. Barren plateau of Germany, about 1,000 sq. m.; average clovation 1,500 to 2,000 ft.

*Eiffel Tower, Paris, 6-84, 6-79 illus.

*Eiffel Tower, Paris, 6-84, 6-79 illus.

Tower.

Eiffel Tower, Paris, 6-84, 6-79 lilus.

Eiger [1'ger]. Peak (13,042 ft.) in Hernese Oberland, Swiss Alps.

Eigs. Isl. of the Inner Hebridos, Inverness-shire, Scot.; area 12 sq. m.; pop. 150; 4-275.

Eight, Piece of. Old Span. sliver coin, the plastre; so called because it was divided into eight sliver reals. In use during 17th and 18th cents.

Eights Week, at Oxford univ., 6-459.

Eights Week, at Oxford univ., 6-459.

Eikon Basilike [Tkon basil'ikē] (the kingly image). Famous book which appeared after Charles I's execution, and professed to be the King's own account of his sufferings in prison, probably written by Bishop John Gauden (1605-62)

Eikonoklastes (image breaker). Milton's defence of the execution of Charles I, written to counteract Eikon Basilke:

written to counteract Eikon Basilike at the Restoration it was ordered to be suppressed and burned by the

at the Restoration it was ordered to be suppressed and burned by the hangman.

Eil, Looh. Sea looh, Inverness-shire, Scot., 4-275.

Einaudi [anow'de], Luigi (b. 1874). It. economist and second pres. of It. republic; opposed Abyssman war; in exic 1935-41; in 1947 app. vice-premier and min. of finance, president May 1948.

Eindhoven. The in Netherlands; pop. 140,554; rly. junct. and industrial centre; radio and electrical factories; 5-370; and Arnhem battle, 1-253.

Einhard [inhahrt] (c. 770-840). Secretary, biographer and son-in-law of Charlemagne, 2-306.

Einsiedein [in'zedein], Switzerland. Th. 20 m. s.z. of Zurich; famous pilgrim resort; Benedictine abbey; reputed birthplace of Paracelsus.

Einsien, Albert (1879-1955). American scientist, 3-205; relativity, 6-360, 3-301; space curvature, 7-149; mathematics, 5-149.

Eire. See Irish Republic.

Eisenach (izznahkh). Summer resort in cent. Ger. at N.w. end of Thuringian Forest; pop. 43,385.

Eisenhower, Dwight David (b. 1890). Allied C.in-C., 1943-45; President of U.S.A., 3-206, 7-363.

Eisenstein, Serget (b. 1898). Russ.
pioneer film director, 2-396.
Eisieben [Iv'liben]. Ger. tn. in Saxony.
20 m. n.w. of Halle; pop. 25,000;
in Russ. zone after 2nd World War.
Eisner, Kurt (1867-1919). Bavarian
Socialist politician; Pres. of revolut.
govt. 1918.

Eisteddfod. Weish festival, 3-207,7-413

Eisteddiod. Welsh festival, 3-207, 7-413
Ejector parachute, used in jet fighter aircraft, 6-75 with ilius.
Ekaterinburg. See Sverdlovsk.
Ekaterinburg. See Sverdlovsk.
Ekaterinburg. See Sverdlovsk.
Ekaterinoslav. See Dniepropetrovsk.
Ekaterinoslav. See Dniepropetrovsk.
Ekaterinoslav. See Dniepropetrovsk.
Elaterinoslav. See Dniepropetrovsk.
Elaterinoslav. See Sverdlovsk.

Elasmobranchii [elasmobran'kil]. Subclass of cartilaginous fishes; includes sharks.

El-Azariych. Sce Bethany.

El Azhar. Mosque and university Cairo, Egypt; centre of Muclim learning, 3-182.

Elba. It. isl. off w. coast; 140 sq. m. pop 26,200; Napoleon exiled to 5-323.

Elba. r. 725 m. long from source in Czechoslovakia to mouth at Czechoslovakia to mouth at Czechoslovakia to mouth at Elberfeld (Ger.). See Wuppertal.

Elbing, Poland. Spt. in former r. Prussia, 5 m. from the sea on r. Elbing shipbuilding, iron and tin workstoxthic mifra; pop 72,000, ceded to Poland from Germany in 1945 and given Polish name of Elbing.

Elbing, Mt., Caucasus, U.S.S. R., highest peak in Europe; 18,467 ft., 2-271 3-308.

Elburz Mts. Range south of Caspian

3-308.

Elburz Mts. Range south of Caspian Ses, highest peak Mt. Demayend (19,500 ft.), 6-133 illue Elchingen [el'khingen]. Vil. in Bayara on Danube, 75 m. N.w of Munich, victory of French under Ney over Austrians (1805).

Elder. Flowering tree, 3 207; elder berries, 3-207 illus.

Elder Brethren. Trinity House official 7-318.

7 -318 Dorado [eldotah'do].

7-318.
El Dorado [eldotah'dō]. Mythical region abounding in gold and precious stones, believed by Sp. explorers to be somewhere in Amerexpeditions in search of, 2-46 Haleigh's search for, 6 362.
Eleanor of Aquitaine (c. 1122-1201 Queen of Louis VII of France divorced, then married Henry II of Eng.; mother of Richard I 5-40, 4-162.
Eleanor of Castile (d. 1290). Queen of Edward I of England, with whom she journeyed on a Crusade, Ricanor crosses, 2-535.
Election, 3-208. See also Ballot; Vote Electors. In Holy Rock. empire Ger. princes with rights of choosing the emperor, 4-188; Charles IV Golden Bull and, 4-8.
Electra. In Ok myth, daughter of Agamemnon and Chylemnestra saved life of her brother Orestee who killed his mother, his father murderer; subject of opera (1909) by Richard Strauss.
Electrical epparatus, alloys in, 1-116 Electrical apparatus, alloys in, 1-116 Electrical recording, 4-58.

2-236.
Electrical recording, 4-58.
Electric clock, 2-417, 5-276.
Electric cooker, 2-496 fillus.
Electric cel, 3-377.
Electric fire, heating properties, 4-149.

Electricity, 3-210; in aluminium extraction, 1-128; and ember, 1-131 battery, 1-386; copper in electrical apparatus, 2-504; Edison's electriciamp, 3-105; Faraday's work on 3-341; frequency control and plezo

ELECTRICAL TERMS IN COMMON USE

These and many other terms used in electrical work, will be found dealt with in greater detail under their own heads throughout the Fact-Index.

Assumulater (or storage battery). A secondary cell that stores current in the form of chemical energy.

Alternating Current (A.C.), An electric current in which the direction of flow changes or alternates.

Ammeter. Instrument for measuring current in supports

current in amperes.

Ampere (A). The practical unit of

Ampere (A). The practical unit of current energy.

Anede. The cloctrode or point through which a current enters a cell, gas discharge tube, or thermionic valve.

Are. Luminous discharge of current.

Armatura. That part of an electrical machine which carries the winding connected to the external supply and in which the principal e.m.f. is induced.

Battary. Two or more primary or secondary cells electrically connected and used as a single unit.

Brush. Conductor arranged to make electrical contact between a stationary

Brush. Conductor arranged to make electrical contact between a stationary and a moving surface.

Capacitanes (C). The property of a body to hold a charge of electricity.

Capacitor, or Condenser, Conducting plates separated by a dilectric (gr.)

Cathods. The electrode or point through which a direct current leaves a liquid or gas; as in a cell or thermionic valve.

Source of electrical energy pro-Gell. Source of electrical energy produced by chemical reaction between two dissimilar metals (or between a metal and carbon) both separately in contact with an electrolyte.

Charge. The quantity, of electricity on a body, e.g., the plates of a capacitor. Also the amount of electricity in a storage buttery.

battery.

Circuit. A number of conductors con-nected together to carry a current. Circuit-Breaker. A switching device for interrupting or restoring the passage of an electric current through a circuit its simplest form is the electric light switch. An example of a protective circuit-breaker is the fuse in a domestic

Goll. A whre conductor in the form of a coll or spiral—it produces electro-magnetic effects, and is the basis of the transformer

Conductor. Material that offers low

Gondustor. Material that offers low resistance to an electric current.

Converter. Machine for converting D.C. into A.C. current or vice versa.

Commutator. Assembly of copper bars each connected to a coil of an armature (q.n.) winding but insulated from each other. The commutator rotates with the armature, and brushes widing on the surface of the commutator large country.

rotates with the armature, and brushes shiling on the surface of the commutation bars collect current from the windings. Goulemb (C). The unit of quantity of electricity. It is the amount of cleetricity that it is the amount of cleetricity earlied by a current of one ampere flowing for one second.

Current (I). The passage of electricity through a body by virtue of a drift of negatively-charged electrons through it.

Cyole. In an alternating electric current there is both reversal and rise and fall of the current and voltage values. One complete series of these events is terined a cycle and can occur many times per second.

Disectris. Substance which offer-relatively high resistance to the passage of an electric current.

Diseabargs. Energy taken from a charged storage battery, or from a circuit through which current is passing.

Disabargs Tube. Any device provided with electrodes and in which an electric discharge takes place in a vacuum if sufficiently high voltage is applied to the electrodes.

Dynamo. Power-driven machine that converts mechanical energy into electrical energy.

Electrolysis. Production of chemical

energy.

Electrolysis. Production of chemical change of a compound in solution by passing through it an electric current.

Electrolyte. A conducting medium or solution through which an electric current flows by virtue of chemical changes or decomposition.

Electromagnet. A piece of iron or steel which is magnetised when a current is passed through a coil surrounding it.

steel which is magnetised when a current is passed through a coil surrounding it.

Electromotive Force (c.m.f.). Force that tends to cause a movement of clectric current in a circuit. The practical unit of c.m.f. is the volt, and its symbol is E.

Electromotical Science that deals with the activity and control of electrons and their practical application.

Electrophoresis. The movement of matter in solution under the influence of an electric current.

Electrostatical Electricity at rest, as electric charges, fields, etc: as distinct from electricity in motion, current farad (F). Practical unit of electrostatic capacitance. That capacitance which, when charged to a potential of one volt, carries a charge of one coulomb Field. That space in the neighbourhood of a charged body, or of a varying magnetic field, throughout which an electric charge would experience a mechanical force.

Frequency (f). The number of cycles which an A C, current completes per second.

Frequency (f). The number of cycles which an AC, current completes per second,

Fuse. Safety device on electrical machines and wiring systems.

Gaivanometer. Instrument for detecting small electric currents

Gauss. The C.G.S. electromagnetic unit of flux density or magnetic induction.

Generator. Machine such as an alternator or dynamo used for converting mechanical energy into electrical energy.

necromical energy into electrical energy.

Gilbert. The C.G.S. unit of magnetonotive force

Grid. An electrode in an electronic
valve whose primary function is tocontrol the flow of current between two

other electrodes.

Henry (H) The practical unit of self or initial inducance.

Hydro-electric Power. Current obtained by converting the energy of flowing water into electrical energy.

Insulator. Material that offers relatively high resistance to the passage of

tively high resistance to the pussage of an electric current

Jar. Unit of capacitance formerly used in the British Navy.

Joule (J). The M K S unit of work or energy. It is the work done in one second by a current of one ampetowing through a resistance of one ohm.

Kilowatt (kW) Unit of electrical power equal to one thousand watts.

Kilowatt-Hour (kWh). British Board of Trade unit of electrical work. It is the work done when a rate of work of 1,000 watts (electrical) is maintained for one hour.

n one hour.
Lanz's Law. States that the direction of a current induced in a circuit as a result of a change in the interlinking shetween the circuit and a magnetic field is such as to oppose the motion which produces it.

which produces it.

Magnet. A mass of iron or other
material having the property of attracting or repelling other sees of iron

Magnetic Field. Space in the neighbourhood of an electric current, or of a
permanent magnet, throughout which
the forces due to the current or magnet
can be detected.

Magnetism. Property of iron, steel,
ing or repelling other magnets.

Maxwell. The C.G.S. unit of electromagnetic flux.

maxwell. The C.G.S. unit of electromagnetic flux.

Maga or Meg (M). Prefix signifying one nillion times, chicfly used in electrical work, e.g. megacycle, one million cycles; megavolt, one million volta; megawatt, one million watts; megohm, one million

Mho. Name sometimes used for the practical unit of electrical conductance.

Negative (—). One of two points between which an electric current exists.

Oersted. The centimetre-gram-second unit of ungentising or magnetic force. Ohm (Ω). Practical unit of resistance. Parallel. Two or more conductors so connected that when current flows in the circuit it is divided between them.

Period (T). The time during which an alternating current passes one through its complete evele of values.

Photo-Electric Cell. Electronic device the electrical properties of which undergo change when exposed to light.

Poles. Those points on a magnet where the lines of force converge. The positive (+). One of two points. where the lines of force converge. The positive and negative terminals of a cell Positive (+). One of two points between which there is passage of an electric current Opposite of negative Potential Difference (V). A difference in the electrical states existing at two points, and which causes a current to flow between them Resolance (X). The characteristic of the impedance (teststance) to the flow of an A C current in a circuit.

Resolfier. Device for converting an alternating current into a direct current Relay. Any piece of apparatus in which small electric power is used to control greater dectric power.

Resistance (R). The property of a substance whereby it risks the passage of electricity. It is measured in obins. Resister. A piece of apparatus placed in a circuit to resist current flow.

Rheostat. A resistor which can be interested to the control greater dectrice.

Rheostat, A resistor which can be altered to vary the amount of resistance a circuit offers to the passage of an electric current.

electric current.

Series. Two or more circuits or cellsconnected in such a way that the same
current flows through all of them

Short Girenit. Condition ceated whenthe terminals of a generator, cell, battery
or other source or conveyor of electrical
energy are acid in tilly connected by a
conducting path of low resistance.

Solenold. A coal of wire wound in
the form of a cylinder so that its length
is large compared with its radius. When
D C is passed through the wire the
solenold behaves like a bar magnet.

Transformer. Device for converting
electrical energy is ceived at one voltage
of clertrical energy sent out at a different
sitage.

· ltage.

volt (V). Practical unit of electro-motive force or pressure. It is that electromotive force which, applied stead-ily to a conductor the resistance of which is one ofmi produces a current of one ampere. Voltate Cell. Source of electrical energy depending on channel action and complete in itself, as in cells or storage batteries.

storage batteries

Voltmeter. Instrument for measuring
the value of an electrical pressure
between two points.

Watt (W). Practical unit of electric
power. It is the amount of energy
expended per second by an unvarying
current of one ampere at a pressure of
one volt

Wet. Mar. (WA). The unit of along

Wak-Hour (Wh). The unit of elec-cal e ergy. It is the amount of work trical e ergy. It is the amount of wo done by one watt acting for one hour.

done by one wat acting for one nour.

Wave. In electricity, the graphic form of an electrical disturbance induced along a conductor. Its maximum velocity is equal to that of light (186,282 miles a second). In radio, a disturbance propagated through free space and having the nature of a travelling magnetic field accompanied by an electric field at right angles to it.

accompanied by an electric field at right angles to it.

Wavelength. The distance between two similar and successive points on an atternating current wave. In radio, the distance, measured radially from the source, between two successive points in free space at which an electromagnetic wave has the same phase.

Weber. The practical unit of magnetic diax.

electricity, 6-196; as lightning, 4-504, 505; and magnetism, 5-84, 85; radiation, 6-339; radio, 6-341, 7-376-377 with illus.; silver as con-7-37-37 with flust; suver as con-ductor, 7-56; submarine cable trans-mission, 2-152; transformer, 7-307 with films: generated by water power, 4-217; power from Ningara power, 4-217; power from Ningara Falls, 5-429. See also Electrical Terms

Falls, 5-429. See also Electrical Terms (li t).

Electricity meters, how they work, 5-183 with illus.

Electric light and power, 3-217; methods of producing electricity.

Electric micro-second flash tube. Type of imp u d d in pho o raphy, 4-444. Electric micro-second flash tube. Type of imp u d d in pho o raphy, 4-444. Electric railways, 6-356. Electric railways, 6-356. Electric railways, 7-345.

Electric traction, and underground railways, 7-345. Instrument for testing the medical condition of the beauty.

estro-cardiograph. Instrument for testing the medical condition of the heart.

heart.

Electrocution, or killing by electric shock. A form of capital punishment practised in parts of the U.S.A. First adopted in New York state, 1888.

Electrode. Conductor by means of which a current passes into or out of a liquid or gas, e.g., the electrode of a cell or storage battery; of a discharge tube, or of an electric funace, 1–386.

Electrodynamics. Science that decide

furnace, 1-386.

Electrodynamics. Science that deals with electricity in motion, e.g., electric currents, as distinct from electric currents, as distinct from electricity on the plates of a capacitor. Ampère (g., e.) said the fundamental lews governing the theory of electrodynamics, 3-210.

Electrolysis. Production of chemical change of a compound in solution by passing through it an electric current. The conduction of electricity through the solution is accompanied by an actual transfer of

tricity through the solution is accompanied by an actual transfer of matter, as shown by chemical changes at the electrodes, 3-220; in electropiating, 3-225.

Electrolyte. A conducting medium or solution through which an electric current flows by vitue of chemical the contract of the convention and the

current flows by vittue of chemical changes or decomposition and the consequent movement and discharge of ions, 1-386; in aluminium extraction, 1-128.

Electromagnet. A piece of iron or steel which is magnetised when an electric current is passed through a coll surrounding it. The iron or steel core then behaves as a magnet, 3-215; in dynamos, 3-113; salvaging metal, 4-289 illus.; and ultrasonics, 7-344.

Electromagnetic induction, 3-211; Faraday and, 6 311.

Electromagnetic rays. See Ultraviolet Rays.

Electromagnetic waves, 3-221, 6 340

violet Rays.

Electromagnetic waves, 3-221, 6 340 illus. f.; ekectromagnetic theory of light and ether, 3-301; Faraday's experiments, 7-307; Maxwell's work on, 5-150.

Electromotive Force (e.m.f.). Force that tends to cause a movement of electric current in a circuit; the chemical (cell) or mechanical (generator) condition for producing electromagnetic energy by the transfer of electricity (current) in a certain direction. The practical unit of e.m.f. is the volt, and its symbol is E; of cell, 1-386; of generator, 3-142.

Electron. An elementary particle

3-142.
lestron. An elementary particle containing the smallest negative electric charge, it is the movement of electrons in a conductor that constitute an electric current. Although normally existing within an atomic system, electrons may be

isolated from matter, as in cathode rays, 3-221, 3-212; and television, 7-252; in electronic devices, 3-222; and valency, 2-318; and spootra, 7-128; behaviour in chemical reaction, 1-11; and radio, 6-340 filts. f.; 7-376; in X-ray tubes, 7-507. Electron gun, and television, 7-252. Electronic calculating machines, 2-170 with filts.

with illus.

Electronic devices, 3-221; in radar, 6-338. See also Photo-electric Davines

Electronics. Field of physical science ectronics. Field of physical science that deals with the activity and control of electrons; also the practical application of electron emission by cathode ray tubes and thermionic valves as in radio, television, radar, and counting and computing devices.

8 -221.

8-221.
Electrophoresis. The movement of colloidal particles (matter in solution) under the influence of an electric current.
Electroplating. Coating with metal by electrolysis, 3-223, 7-523; silver used to 7-52. -56.

in, 7-56.
Electroscope. Instrument for detecting presence of electricity, 3-216.
Electrostatics. Phenomena exhibited by electricity at rest, as electric induction in conductors, etc., as distinct from electricity in motion, as electric currents, electromagnetisation, etc., 3-210, 214.
Electrotysing. In printing, the pro-

electric currents, electromagnetisation, etc., 3-210, 214.

Electrotyping. In printing, the precess of producing copper facsimiles of type and illustrations. A wax mould is taken of the original material, dusted with graphite (to increase electrical conductivity) and suspended in a solution of sulphate of copper. An electric current through the solution causes a copper shell to be formed on the mould. This shell is removed from the mould and a strengthening backing of molten type-metal added; the completed plate is approx ½ in thick. Electrovalence. A chemical bond in which an electron is transferred from one atom to another, the resulting ions being held together by electrostatic attraction. Formation (chemical theory of atom), 2-313 with diag.; and dissociation of molecules, 4-278.

Electrum. An alloy of gold and silver.

Electrum. An alloy of gold and silver, 1-114; used by Greeks for jewelry, 4-372.

1-114; used by Greeks for jewelry, 4-372.

Elegiac poetry, 6-235, 6-504.

Elementary schools, 6-504.

Elementary schools, 6-504.

Elementary ashools, 6-504.

Elementary and a series in history of chemistry, 2-316; periodic table, 3-221; pavy's work on, 3-51; true gases in, 3-510; Mondeléev's Periodic Table, 5-169; sootopes and, 4-301; radio-activity, 6-351; in order of increasing weight, 1-297.

Elenth Hills, Wales, 6-353.

Elephant, 3-225, 1-61 illus.; African, 1-65; foot, 3-413 illus.; hair, 5-100; howdahs on, 7-45 illus. f.; ivory from, 4-331; teeth, 5-102; sacred white elephants, 7-48.

Elephan'ta Isle. Small isl. between Bombay and mainland of India; interesting for Hindu religious sculpture; named from there.

Elephant beetle, found in W. Indies, 1-112.

Elephantiasis (elefanti'a'sis), or "elephant akin" disease in which parts of body swell enormously and skin becomes discoloured and hardened. Elephantine [elefanti'ne], Eg. Small isl. in the Nile opposite Assuan (Syrene); anc. monuments and nilometer (water-gauge). Elephant's ear. See Begonia. Eleusinia. In anc. Greece, festival of goddess Demeter and Persephone, 3-69, 1-288.

Eleusis [elb'sis]. Anc. city in Attica, Greece, or coast opposite isl. of

Georgia (1-200.)

Greece, on coast opposite isl. of Salamis; in early times a powerful rival of Athens: Eleusinian mystories, 1-288, 8-69.

See Architectural Terms. Elevation.

ELIZABETH

Elevator, in aeroplane, 1-38, 39 diag.
Elevator. Name used in U.S.A. for a passenger lift, 4-495.

Elgar, Sir Edward William (1857-1934).
Eug. composer. 3 227. 5-308.
Elgin, James Bruce, 3th Earl of (1811-63). Eldest son of 7th earl; gov. of Jamaica (1842-46); gov.-gen. of Canada (1846-54); viceroy of India 1860 to his death.

Elgin, Thomas Bruce, 7th Earl of (1766-1841). Brit. diplomat and art collector, envoy to Beiginn, Prassia, and Turkey. Brought Elgin marbles (great sculptures from the Parthenon and clsewhere) to London in 1866 – now in 1814. Museum, 3-228, 229.

Elgin, Victor Alexander Bruce, 9th Earl of (1849-1917). Brit. statesman; vicercy of India 1894-99.

Elgin. Co. tn. of Morayshire, Scot.; pop. 10,535; history, 5-261.
Elgin Marbles, 3-228, 5-121, 2-88.
El Greco. See Greco, El.

Eli. Hebrew priest and judge, under whose care Samuel was brought up

Ell. Hobrew priest and judge, under whose care Samuel was brought up (1 Samuel). Elia [c'lia]. Pen-name of Charles Lamb,

(1 Samuel).

Elia [c'ila]. Pen-name of Charles Lamb,
4-141.

Eli'jah. Hebrew prophet; denounced
Ahab, king of Israel, for idolatry,
destroyed the 450 prophets of Raal,
was carried to heaven m a charlot of
fire (1 Kings xvii; 2 Kings n).

Eliot, Charles William (1831-1926)
Amer. univ. teacher; pres. of
Harvard Univ., U.S.A., 4-131.

Eliot, George (1819 80). Pen name of
Mary Ann Evans. Brit, novelist,
3-229; MS. of, 3-290 illus.

Eliot, Sir John (1592-1632). Fing
statesman. Parl. kader with Pum
and Hampden against Charles is
encroachments; promulgated theory
of a responsible ministry; im
prisoned for 2 years and died in
Tower of London.

Eliot, Thomas Stearns (b. 1838). Anglo
Amer, poet and dramatist; natural

Ellot, Thomas Stearns (b. 1888). Anglo Amer, poet and dramatist; natural ised Birt, subject (1927); awarded O.M. and Nobel Prize for literature in 1948; made his name with The Waste Land (1922); other works incl. Murder in the Cathedral (1930), 3-122 illus; The Foundy Remnon (1939); Four Quarets (1944); The Cocktail Pary (1949); The Confidental Clerk (1953), 3-291.

Ellis. Important city of anc. Greece on r. Peneus; here all candidates for Olympic games trained for a month Ell'sha. Hebrew prophet, on whom lell the "mantle of Elljah," his musici and predecessor in struggle against Baal worship (1 Kings xix; 2 Kings xiii).

xiii).

xiii).

Elissa. See Dido.

Elixir of Life, in alchemy, 1-95.

Elizabeth, St. (1207-31). Hungarian princess; according to legend broad she carried for the poor, serzed by her husband, was turned to roses.

Elizabeth (1837-98). Austrian empressible of Francis Joseph, assassinated at Genova by an anarchist.

Elizabeth (b. 1876). Queen of Albert 1 of Belgium, former princess of Bavaria.

of Belgium, Bavaria. (1596–1662). Rohemia. Elizabeth

Bavaria.

Elizabeth (1596-1662). Queen of Frederick of Bohemia, and daughter of James I of England, ancestressthrough her daughter, the Electressophia of Hanoverlan and Windson sovereigns of England.

Elizabeth I (1533-1603). Queen of Eng., 3-230; and Drake, 3-114 and England's sea power, 3-277 at Kenilworth, 4-398; and Man Queen of Scots, 5-142; and Raleigh 6-362; Reformed Church, 2-381 riding boot, 2-14 illus, 1 the Roval Shawms (band of musichns) 5-309. handwriting of, 7-503 illus.

Elizabeth II (b. 1928). Queen of Gt Brits. N. Ireland, and of her other realms and territories, head of the Commonwealth. 3-235. 1-frontistic Canada, 2-194, 2-204; coinage, 5-333 illus, f.; coronation, 2-509 511 illus., 3-235 illus.; and Gir. Guides, 4-24; opening Parliament. 6-90 illus.; Philip, Duke of Edin burgh, 6-154; titlos of children, 6-463

Elizabeth (1465-1503). Daughter of Edward IV and queen of Henry VII

of Eng.

Elizabeth (Queen Mother) (b. 1900).

B it. queen, consort of George VI,

2 236, 6-450 illus.; ancestry, 3 523.

Elizabeth. Queen of Carol I of Rumania.

See Carmen Sylva.

mania. See Carmon Sylva.
Elizabeth (1709-62). Empress of Russia;
daughter of Peter the Great and
Catherine I; selzed throne (1711);
slided against Prussia in Seven Years'
War; only her timely death saved
Frederick the Great from military

di-aster.

Elizabeth Marie Hilene (1764-94), commonly called "Madame Elizabeth," sister of Louis XVI of Fr., executed by revolutionary tribunal.

Elk. Largest member of the deer family: the Amer. variety is known as moose, 5-260, 3-60, 5-464.

Elkhound, Norwegian. See Dogs (list). Elkhound, Norwegian. See Dogs (list).

Ell. Medieval European measure of length, now disused. Varied in different countries. The Eng. ell was 63 ms. the Scottish 37 ins., and the Fiemish 27 ins., and [1790-1871). Brit. administrator; gov. gen. of India; annexed Sind.

gov. gen. of Hota; annexed Sinc. Etienborough, Edward Law, 1st Baron (1750 1818). Brit. judge: chief counse for Warren Hastings; be-came ford chief instice. Eilerman, Sir John Reeves (1862 -1933).

British shipowner; left fortune of nearly £37,000,000. lesmere. Lake in Shropshire, Eng.. Ellesmere.

7 14.
Ellesmere Island. N.W. f. Greenland.
Almost covered by lee caps; explored by Brit. expedition in 1931-

ploted by Brit. expension in 1881-35.
Elines (clis) or Lagoon Islands. Group of small cord isls. In Gilbert and Elines Islands colony, belonging to Gt. Brit., in Pacific, N. of Fill Isls.; 14 sq. in.; pop. 4,613; 6 28.
Elliotson, John (1791-1868). Brit physician, one of the first to urke clinical lectures in teaching medicine; physician to both Dickens and Thackeray; Podena 8 dedicated to him.

Pendenn 8 dedicated to him. Elliott, General (Brit. soldier). Heathfield, Lord.

Elliott, General (Brit. soldier). See Heathfield, Lord.

Elliptical tough-shell. A molluse, 5-232 illus. f.
Ellis Island. Small isl. in New York Buy, used from 1892 to 1954 as U.S.A. Immigrant station 5-413.

Elliora. Tu. in Hyderabad, India: rock monasteries, 2-281.
Ellisworth, Lincoln (1880-1951). Amer explorer; flight across Antarctic, 6-217.

Elm. Deciduous tree, 3-236; cork butticeses in, 2-505; chromosomes, 2-25; 7-314 flins.
El'man, Mischa (b. 1891). Rus, violinist and composer (Humoresque).
Elmira. City of New York state, U.S.A., on the Chemung r. Its coll. for women (1855) was first U.S. coll. to give women degrees comparable with those of men. Pop. 49,716.
Elohim [676him]. God of the Hei rews. El Paso (clpah's6), Texus, U.S.A. Rly, centre and main distributing point for s.w. U.S., and main gateway between U.S. and Mexico; important smelting industry; pop 130,138; 7-260.
Elsinore [el si-nōr'] (Danish Helsinger), Denmark, spt. on N.E. coast of isl. of Zealand; pop. 15,000; ship-

Elsinore [cl si-nor'] (Danish Helsingur).
Denmark, spt. on N.E. coast of isl.
of Zealand; pop. 15,000; shipbuilding, commerce; scene of Shakespeare's Hamle!
Elster or White Elster. R. of Cent.
Ger. emptying into Saale 3 m. 8. of
Halle; 115 m.
Elstree. Tn. of Herts; pop. 3,460;
a centre of British film industry
4-173.
Elswick. Sulumb of Newcostle.upon.

Elswick. Suburb of Newcastle-upon-Tyne, Eng.; shipbuilding and arma-ment manufacture.

Elver. A young eel; life cycle, 3-170 with diag.
Ely. Mkt. tn. and cath. city of Cambs, Eng.; pop. 9,989. 3-237. 2-182

cathedral, 3-252, 2-270 illus.; He ward the Wuke's defence, 4-169.

ward the Wake's defence, 4-169, Ely, Isle of, England; an administrative co.; pop. 89,038; 2-182. Elyot, Sir Thomas (c. 1490-1546). Eng. diplomat and scholar; friend of Sir Thomas More: remembered for his books. The Caelle of Health, and The Book Named the Goresnor.

Elysium [ellz'ium], or Elysian Fields. In Gk. myth., a place to which the souls of the good depart at death; sometimes identified with Fortunate

lales (q.v.).

vira. Wing covers of beetles and

lales (q,v).
Elyira. Wing covers of beetles and other insects; they usually cover the back of the insect, and the bind wings are folded under them; of lady bird, 4-436.
Elzevir fel'zeverl. Family of Dutch 17th-cent. printers famous for beautiful types and choice grade of paper: Louis (1540-1617) began printing in 1583, his five sons carried on the work.

Emanation (Em). Ser Radon.

Emancipation Proclamation. Abolish-ing slavery in U.S. A. (Sept. 22, 1862).

lug slavery in U.S. A. (Sept. 22, 1862).

Emanuel I, the Happy (1469-1521).

King of Portugal, in whose teign, called "Portugal, in whose teign, called "Portugal's golden age," Vasco da Gama opened sea route to India, Cabral took possession of Brazil, and Albuquerque established Port, rule in the E. Indies.

Embalming, Egy pt. Mummies, 5-20).

Embankment, The. London thorough fare, incl. (on the left bink of the Thames) the Victoria Embankment (from Westminster bridge to Blackfuars bridge) Grosvenor Rd., and the Chelsea Embankment; on the right friars bridge) Grosvenor Rd., and the Chelsea Embankment; on the right bank, between Westminster Bridge and Vauxhall, is the Albert Embank-ment; and, between We tmin-ter and Waterloo bridges, is son it Bank, Embankment, a form of dum, 3–30. Embassy. The person or persons sent

as ambassadors or those entrusted with public messages to another state; also the official residence of an ambassador

state; also the official residence of an ambasador
Ember days. In the Anglican and R.C. Churches, fasts of the four seasons. They are the Wed, Fil., and Sat., after the 1st Sunday in Lent; Whitsunday; Holy Cross Day (Sept. 14); Feast of St. Lucy (Dec. 13). Introduced in Eng. by St. Gregory (590-664).

Embez'zlement. The fraudulent appropriation of money or other personal property by one employed in official capacity.

Embiopiers. Order of insects. 4-2°0.

Emblems, National. See Floral Emblems (table).

Embryo, Young of plant or animal in earliest stages of development from seed or egg; 3-239; of chicken.

3-230 illus.; frog spawn, 3-240 illus; wheat germ, 3-394.

Embryology. The study of the reproduction and development of plants and animals, 3-239, 1-450, founded by yon Baer, 7-527; advances in anatomy, 1-144; and evolution, 3-323.

anatomy, 1-144; and evolution

emerald isle. The Ni kname of Ireland. 4-281. Ralph Waldo (1803-82).

Emerson, Halph Waldo (1803–82).
Amer. essayist, poet and philosopher.
3–241, 7–364.
Emery. A very hard mineral; composed of corun lum(aluminium oxide), and iron formerly exten ively used and from to merit exten ively used in powdered form as an abrasive and polisher. Emetic. Substance administered medi-cinally to cause vomiting: mustard, 5-312.

Emett, Rowland. British cartoonist.
Noted for his drawings of fantastic
rullanys, etc., in Punch.
Emilgration. Departure from one

Emigration. Department from one country to settle in another; career opportunities. 2 238; famine and Irish emigration. 4 252
Emigras. Refugees from the Fr. Roy.; Influence on Louis XVI. 3 168.
Emile. Work by Rousseau on the education of children, 6 459.
Emilia. Division of N. R., sof the Poand N. of Priscany, pop. 3,339,000, 8,537 sq. m. 4 304.

8,537 sq. m. 4 304.

Eminent Victorians (1918). Biographies by Lytton Standey, 1-446.

Emin Pasha (1840-92). Turkish name of Eduard Schnitzer, Ger. explorer and administrator in Africa; rescued by Stanley, 7-145.

"Emitron." Type of iconoscope, or electron camera, used in television for photographing the picture to be televised and transmitted to a receiver. It consists of a cathode-ray tube (2.2), the narrow end of which proacets a It consists of a cathode-ray tube (1.7.), the narrow end of which projects a cathode-ray beam against the broad end or screen. The latter comprises a mosaic of photo-emissive material upon which the optical image is focused, and the current variations so induced convert tone shades of the image into electrical impulses, 7–252 illus.

Emmanuel College, Cambridge Univer-

mmanuer conego, v.m., sity, 2–182, m'met, Robert (1778–1803). Irish revolutionist who was hanged Sept. 20, 1803 for plotting a rising in Dublin.

Emmett, Daniel Decatur (1815-1904). Amer. actor and song writer, originator of "Negro minsteel" per-

formances; author of Dirie, Emotion, 3 241; and indigestion, 3 90; psychiatry, 6 299. Emperor Moth, 2 114 illus.

Empire Day, May 24 (birthday of Queen Victoria), which is observed throughout the Birt, Commonwealth, particularly in schools; officially teeggnized in U.K. in 1904 but first

olserved in Canada in 1897.
Empire State Building, New York elty,
5 112; time taken by lift to top,
4 195.

4 195.
Empirical formula. In chemistry, 1-11.
Empiricism, in philosophy, 6 159.
Employment. Scc Careers.
Ems or Bad Ems. Ger. health resort on r. Lahn 10 m. E. of Coblenz; pop.

r. Lahn 10 m. D. of Coblenz; pop. 7,000. Ems, r. in Westphalia and Hanover.

Ems, r. in Westphalia and Hanover, Germany; flows N.W. 200 m. to North Sea; rrigates surrounding country by a series of canals. Emu. Large flightless bind, 3-242, 1-312, 315 illus.; as relative of ostrich, 6 9, egg, 3 171 illus. Emul'sion. A liquid mixture in which a fatty substance is suspended in minute globules; 2-455. Ena Harkness. Variety of rose, 6-452 illus. f.

illus. f. Enamel and Enamelling, 3-242; in pewelry, 4-372; types of paint, jewel 6-38.

neasonia Feast of dedication or renewing, sap. anniversary of dedi-cation of church or temple. At O-ford Univ., a term for Com-

O ford Univ., a term for Commemoration.

Encarnación. Tn. in Paraguay; pop. 160,000; 6-76.

Encaustic (Gk., burnt in). Method of painting with colours and wax, practised by anc. Egyptisns and Greeks. Technique of process not

known.
Enchanter's nightshade. Plant, 5-439.
Enclosure of land, in Eng. history, 2-473, 474; effect on agriculture, 4-259.

4-259.
Ency'ellesi Letters. Ecclesiastical letters sent on some important occasions by the Pope to his bishops.
An Encyclical differs from a Bull in not dealing with any special case; it indicates general principles to guide the bishops.
Encyclopaedia Britannica, 3-245.
Encyclopaedia, 3-245.

IMPORTANT FOOD FISHES OF THE BRITISH SEAS

Name	Description	Habits	Remarks	
Cod	Sea fish with long barbel under chin. Back and sides green- ish with brown spots. May weigh as much as 100 lb.	Will apparently eat anything, but largely predaceous. Abounds in British seas during the spawning season in spring.	Apart from herring, the world's most valuable food fish Cod fisheries are an important industry in many countries. A valuable food fish; will keep on ice longer than most varieties. "Finnon haddie" (Findon haddock) is smoked haddock.	
Haddock	Resembles cod, with smaller mouth, dark spot behind head. Black lateral line. Average size, 3 to 4 lb.; largest. 20 lb.	Found on cod fishing-grounds in large schools; feeds on bottom of the sea, and unlike cod, chiefly eats molluses and crustaceans.		
Hake	Member of the cod family, dark grey on back, lighter below, no barbels. Rarely more than 3 ft. long.	Fairly common in British waters, especially off the Cornish coast; feeds chiefly on pilchards.	Flesh is white and of good flavour.	
Halibut	Member of the flat-fish family, with both eyes on right side. Dark above and whitish below. Average weight, 50 to 75 lb., but grows to an enormous size.	Has about same geographical range as cod, showing a pre- ference for cold water. Feeds on crabs, molluses, and on other fish.	Important as a food supply; halibut liver oil has recently largely replaced cod-liver oil in medicine. Food value greater than cod but less than mackerel.	
Herring	Well - formed sea - fish, thin scales, blue-green above, sil- very-white below. Average length 12 in.	Great schoo's come into shallow water to spawn. Principal food, plankton.	Most important food fish in world; not used as exten- sively in America as in Europe.	
Mackerel	A perfectly proportioned sea- lish, varying in length from 10 to 20 in., in weight from ½ to 3 lb. Bluish or green with wavy black stripes on top, silvery beneath.	Travel near the surface of the sea in huge schools, some- times so large as to cover 10 square miles. Feed on small occun fish.	Caught in nets and on line Highly prized for food, espe- cially fresh. Spanish macketel (found in both North and South Atlantic) are not so abundant.	
Plaice	Flat-fish, darkish-brown with red spots on upper surface, eyes on right side; never a large fish, usually 10 to 13 m. in length.	Like other flat-flsh, feeds on hottom, when adult eats shell-flsh; in summer lives offshore, in winter inshore and in estuaries.	Most important flat-fish of British seas, though many small plaice are destroyed as unmarketable.	
, Salmon	Large fish living in salt and fresh water; nearly 100 spe- cies. Brownish above with silvery sides, black dotted; flosh reddish-orange	Ranges northward of Spain in Europe, and of New York in N. America. Spends much of life in salt water, enters fresh- water streams to spawn.	Salmon are caught in nets as well as on rod and line in Britain; season strictly limited by law. Among the most esteemed food fishes.	
Smelt	Small fish related to the salmon, and silvery in colour.	Found in some English rivers, including the Medway and on the east and west coasts of Great Britain.	Prized as food because of deli- cate flavour. When tresh they have a smell resembling cu- cumbers.	
Sole	Small flat-fish of oblong form, brown, blotched above, whitish below; eyes on right side. Several closely related species. Lemon sole belongs to plaice genus, as also does the dab.	In common with place and other fat-flah, likes a clean, sandy bottom, and is chiefly caught in inshore waters.	The true sole is often considered finest-flavoured of all sea-fish and is correspondingly valuable as a fishery. Lemon soles and other similar fish are often substituted for it.	
Turbot	Large sea-fish of the flat-fish family: brown above whit- ish below, sometimes attain- ing weight of 70 lb.	Ranges from the Mediterranean to the coast of Scandinavia. Feeds on crabs, sea-urchins, and fish eggs.	Highly estcomed as food; one of the best of flat-fishes.	
Whiting	Small member of cod and had- dock family distinguished by lighter colour and black spot at base of pectoral fin.	Common in shallow and me- dium waters from North Sca to Mediterranean.	Popular food fish, and one of the cheapest.	

narrow sea-coast inict, usually steep sided and very deep, 6-187 illus.; in Norway, 5-462, 484 illus. Flabellum. Medieval fan used in church ceremonies, 3-340. Flag, type of Iris, 4-281. Flag. South Carolina, U.S.A.; scene of first
engagement of American Civil War.
Fortuna. In Rom. myth., goddess of
fortune, the Gk. Tyche; a goddess
of chance, giver of prosperity, controller of destinies; shown with
cornucopia, a rudder, a wheel or
globe.
Fortunate Isles, or Isles of the Blest.

Fortunate Isles, or Isles of the Blest. Legendary islands of classical times, 1-295; identified with Canary Isles, 2-208.

Portunatus [fortuna'tus]. Horo of European folk-tale, possessor of proverbial inexhaustible "For-tunatus purse" and wishing-cap which would transport him wherever he desired to go.

SOME RECORDS IN FOOTBALL

Football Association Cup

Winners Most Times Aston Villa and Blackburn Rovers have won the Cup 6 times, and The Wanderers (amateurs) won it 5 times.

Bury 6 goals, Derby County ml, in 1902-03.

Greatest Number of Goals in Final Tie n · Blackburn Rovers 6 , Sheffield Wednesday 1 ; in 1890. Blackpool 4 ; Bolton Wanderers 3 ; in 1953.

Highest Score in Any Tie in 1887 Preston North End beat Hyde in a F.A. Cup Tie by 26 goals to nil.

Medals
Lord Kinnaird, C. H. R. Wollaston, and J. Forrest each won
5 F.A. Cup winners' medals

Cup and League
Preston North End in 1888-89, and Aston Villa in 1896-97
won both the Cup and the League (First Division) in the

When Preston North End won the Cup and League in 1888-89 'hey did so without a goal being scored against them in the Cup competition and without losing a League match. Bury won the Cup in 1903 without a goal being registered against them in any of the ties.

In 1923, 126,047 spectators (official r-turn), saw Bolton Wanderers (2) beat West Ham United (0) at Wembley.

The Wanderers and Blackburn Rovers each won the Cup in three successive years, the former in 1875-76, 1876-77, 1877-78, and the latter in 1883-84, 1884-85, and 1885-86.

Football League

Championship Record
Arsenal have won the League (Division i) Championship most times-seven

"Dixic" Dean, of Everton, in season 1936-37 passed Stephen Bloomer's long-standing record of 352 goals in League football; his total at his retirement in 1939 was 379; in 1927-28 he scored 60 goals.

League and Cup
Winners of both in one season—see under Cup and League.

International Football

Record Attendance
In 1937, 149,547 spectators were admitted by ticket to see
Scotland beat England 3—1 at Hampden Park, Glasgow.

Wright (England) gained *1 International Caps; W. Meredith (Wales) 51; R. Crompton (England) 34; K. Scott (Ireland) 32; and A. Morton (Scotland) 30. Including both International and Amateur International matches, V. J. Woodward was capped 60 times. Including war-time (1939-45) games, Stanley Matthews played 73 times for England.

Miscellaneous

Ne Goals Against

During the first seven years of their existence Queen's Park

(Glasgow) did not have a goal scored against them.

Record Score against them.

Record Score

36 goals to nil scored by Arbroath Against Bon Accord in a Scottlish Cup Tie, Sept. 5, 1885; on the same day Dundee Harp defeated Aberdeen Rovers in the same competition by 35 goals to nil.

Won Every Match
